FOREWORD

Part II of this report was prepared by Boeing Computer Services, Inc., in conjunction with The Boeing Company, Commercial Airplane Group, Renton, Washington for the Aerospace Dynamics Branch, Vehicle Dynamics Division, Air Force Flight Dynamics Laboratory, Wright-Patterson Air Force Base, Ohio, under Air Force Contract AF 33615-70-C-1126, "Unsteady Aerodynamics and Flutter of Wing Horizontal Tail Configurations in Supersonic Flow". This work was conducted under Project No. 1370, "Dynamic Problems in Military Flight Vehicles" and Task No. 137003, "Prevention of Dynamic Aeroelastic Instabilities in Advanced Military Aircraft". Part II of this report is intended to describe in detail the computer program developed under the above contract, and is subsidiary to Part I, Theoretical Development, Program Usage, and Application.

Mr. William S. Rowe of The Boeing Company served as supervisor of the work covered under this contract. The co-authors of this part of the report worked from engineering analyses prepared and documented in Part I by Dr. J. M. Li, C. J. Borland and J. R. Hogley. Mr. Lawrence J. Huttshell of the Aerospace Dynamics Branch (FYS) was Project Engineer. Appreciation is expressed to Mr. H. Huffman and Mr. R. Hirst for graphical work done in this report.

Manuscript was released by the authors in August, 1971 for publication as an AFFDL report.

This report has been reviewed and approved.

Walter J. Mykytow
WALTER J. MYKYTOW
Assistant for Research & Technology
Vehicle Dynamics Division
Air Force Flight Dynamics Laboratory

ABSTRACT

The Mach box technique has been extended to include wing and tail with dihedral angles and vertical separation. A digital computer program, written in FORTRAN, is presented. The program provides for up to nine sweep angles of the leading and trailing edges of each surface. First order piston theory thickness correction is available as an option, and two refinement procedures are provided, subdivision with averaging and velocity potential smoothing. For a maximum of twenty oscillatory mode shapes the program calculates normal washes, velocity potentials, lifts, pressures and generalized forces matrices. If only one surface is being analyzed, sampling of wake up-wash, side-wash and longitudinal wash is available.

|--|----------------|----------------------------|---|
| $C_{l_j}^m$ | -- | 1/length | Local lift coefficient per unit span for the j^{th} mode |
| $C_{m_j}^m$ | SECMOM | $1/(\text{length})^2$ | Local moment coefficient per unit span for the j^{th} mode |
| $\left. \begin{matrix} c_{rW} \\ c_{rT} \end{matrix} \right\}$ | --- | length | $\left\{ \begin{matrix} \text{Wing} \\ \text{Tail} \end{matrix} \right\}$ root section chord length. |
| $\frac{D}{Dt}$ | -- | 1/time | Substantial derivative; $\frac{D}{Dt} = \frac{\partial}{\partial t} + U \frac{\partial}{\partial x}$ |
| $f_j(x,y)$ | DEFSL(1,L) | non-dimensional | j^{th} mode shape deflection at location (X,Y). |
| f_{ij} | --- | non-dimensional | Deflection of i^{th} lumped mass in mode j |
| $\frac{\partial f_j(x,y)}{\partial x}$ | DEFSL(2,L) | 1/length | Slope of j^{th} mode shape function. |
| $\bar{f}_j^{n,m}$ | --- | time | Scaled modal displacement at box n,m $\bar{f}_j^{n,m} = \frac{b_1}{U} f_j^{n,m}$ |
| J | --- | 1/length | j^{th} mode shape deflection / s |
| i | --- | mass x length ² | Moment of inertia about the elastic axis of the i^{th} lumped mass |
| 1_j | --- | force/length | Generalized stiffness |
| β | XKS | Non-dimensional | Reduced frequency based on leading planform semi-span, $k_R = \frac{\omega b}{U}$ |

NOMENCLATURE

| Mathematical Symbol | FORTRAN Symbol | Dimension | Definition |
|---------------------|----------------|-----------------|---|
| k_1 | XKI,K1 | non-dimensional | Reduced frequency based on the chordwise dimension of the Mach box $k_1 = \frac{\omega b_1}{U}$ |
| \bar{k}_1 | K1BAR | non-dimensional | $k_1 M^2 / \beta^2$ |
| L | CAPL | non-dimensional | Vertical separation of the center lines of the 2 surfaces, positive upward measuring from the wing to the tail. |
| $L_j^{n,m}$ | -- | force/length | lift on box n,m for the j^{th} mode |
| L_j^m | -- | force/length | lift on the m^{th} chordwise strip of boxes for the j^{th} mode. |
| L_j | -- | force/length | lift on a complete half-surface or half-airplane for the j^{th} mode. |
| $\bar{L}_j^{n,m}$ | -- | force/length | amplitude of box lift $L_j^{n,m}$ |
| \bar{L}_j^m | -- | force/length | amplitude of section lift L_j^m |
| \bar{L}_j | -- | force/length | amplitude of total lift L_j |
| $\bar{L}_j^{n,m}$ | BXLIFT | non-dimensional | Non-dimensional amplitude of box lift (program output) $\bar{L}_j^{n,m} = L_j^{n,m} e^{i\omega t} = \frac{b_1}{\beta} \bar{L}_j^{n,m} e^{i\omega t}$ |

NOMENCLATURE

| Mathematical Symbol | FORTTRAN Symbol | Dimension | Definition |
|---------------------|----------------------------------|-----------------|--|
| \bar{L}_j^m | SLIFT | non-dimensional | nondimensional amplitude of section lift (program output) $L_j^n = \bar{L}_j^n e^{i\omega t} = q \left(\frac{b_1}{\beta} \right) \bar{L}_j^n e^{i\omega t}$ |
| \bar{L}_j | TLIFT | non-dimensional | Nondimensional amplitude of total lift (program output) $L_j = \bar{L}_j e^{i\omega t} = q \left(\frac{b_1}{\beta} \right) \bar{L}_j e^{i\omega t}$ |
| l | EL | non-dimensional | The l_c coordinate location of a pulse receiving point, i.e., the perpendicular distance from the sending plane to receiving point. |
| M | XMACH | non-dimensional | Mach number |
| M_{jj} | -- | mass | Generalized mass for the j^{th} mode |
| m | -- | non-dimensional | The m_c coordinate location of a pulse receiving point. |
| m_i | -- | mass | i^{th} lumped mass |
| $N_{n,m}^{xyz}$ | ENRUS ENRLS, EN, ENSUBD | non-dimensional | Normal wash at box n,m on surface "xyz" due to local source strength, where possible subscript values are; $x = \begin{cases} R\text{-right} \\ L\text{-left} \end{cases}$ $y = \begin{cases} U\text{-upper} \\ L\text{-lower} \end{cases}$ $z = \begin{cases} W\text{-wing} \\ T\text{-tail} \end{cases}$ e.g. $N_{RUW}^{n,m}$ means normal wash on the right upper wing at box n,m |

NOMENCLATURE

| Mathematical Symbol | FORTTRAN Symbol | Dimension | Definition |
|-----------------------------------|---|------------------------------|--|
| $\hat{N}^{n,m}$ xyz abc | ENRULU, ENRLLL, ENRURW, ENRULW | non-dimensional | Normal wash at box n,m on surface "xyz" due to remote source strengths on surface "abc", where possible subscript values for a,b, and c are the same as for x,y, and z, respectively, defined above; e.g. $\hat{N}^{n,m}$ means normal RUT LLW wash at box n,m on the right upper tail due to source strengths on the left lower wing. |
| N_s | NSUBDV | non-dimensional, odd integer | No. of "sub-boxes" (chordwise and spanwise) to be used in the subdivision improvement technique. |
| n | -- | non-dimensional | the n_c coordinate location of a pulse receiving point. |
| n_c, m_c, l_c | --- | --- | Sending Surface Coordinate System |
| $\bar{n}_c, \bar{m}_c, \bar{l}_c$ | --- | --- | Receiving Point Coordinate System |
| $p, p(x,y,t)$ | --- | force/area | local static pressure |
| p_∞ | --- | force/area | Free stream static pressure |
| $\Delta p(x,y,t)$ | --- | force/area | pressure difference between upper and lower surfaces at point (x,y) at time t $\Delta p(x,y,t) = p(x,y,t)_{upper} - p(x,y,t)_{lower}$ |

NOMENCLATURE

| Mathe- matical Symbol | FORTTRAN Symbol | Dimension | Definition |
|-----------------------------|--------------------|-----------------------|---|
| $\Delta \bar{p}(x,y)$ | -- | force/area | Amplitude of pressure difference: $\Delta p(x,y,t) = \Delta \bar{p}(x,y) e^{i\omega t}$ |
| q_{ij} | | force/length | Generalized force due to the deformation in the i^{th} elastic mode and loading for the j^{th} modal deflections |
| \bar{q}_{ij} | -- | force/length | Amplitude of generalized force |
| $\bar{\bar{q}}_{ij}$ | GENAF | non- dimensional | Non-dimensional generalized force (program output); $q_{ij} = \bar{q}_{ij} e^{i\omega t} = q \frac{b_i}{\beta} \bar{\bar{q}}_{ij} e^{i\omega t}$ |
| \hat{q}_{ij} | QAGARD | $1/(\text{length})^2$ | Generalized force in the AGARD notation |
| q'_{ij}, q''_{ij} | GENAFC | $1/(\text{length})^2$ | Real and imaginary parts of \hat{q}_{ij} in the AGARD definition (program output) |
| q | -- | force/area | dynamic pressure |
| $q_j(t)$ | -- | length | Generalized coordinate relating physical deflection to j^{th} modal deflections: $z(x,y,t) = \sum_j f_j(x,y) q_j(t)$ |
| \bar{q}_j | -- | length | Amplitude of j^{th} generalized coordinate |
| s | S | length | Wing semi-span. |

NOMENCLATURE

| Mathe- matical Symbol | FORTRAN Symbol | Dimension | Definition |
|---|-------------------|---------------------|--|
| S | -- | length ² | Area of integration. Bounded by edge of planform plus diaphragm and lying inside the forward Mach cone of the receiving point. |
| t | -- | time | Time |
| U | -- | length/ time | Free stream velocity. |
| $U_{\overline{\mu}\lambda}$ | --- | non- dimensional | Velocity spatial AIC for perturbation velocity parallel to the free stream. |
| u | --- | length/ time | Perturbation velocity in the stream-wise direction, positive downstream. |
| $V_{\overline{\mu}\lambda}$ | V | non- dimensional | Velocity spatial aerodynamic influence coefficient (AIC) for velocity normal to the free stream and parallel to the sending surface. |
| $\begin{matrix} (xy) \\ v_{ab} \\ \overline{\mu}\lambda \end{matrix}$ | V | non- dimensional | Spatial AIC giving velocity normal to the free stream and parallel to surface "ab" at a point on surface "xy" or in the flowfield (FF), due to constant normal wash over a box on surface "ab" |
| v | | length/ time | Perturbation velocity in the span-wise direction, positive right (looking upstream). |
| $W_{\overline{\mu}\lambda}$ | W | non- dimensional | Velocity spatial aerodynamic influence coefficient (AIC) for velocity normal to the sending plane. |

NOMENCLATURE

GLOSSARY OF TERMINOLOGY

Aftmost Box - Each chord on each planform and diaphragm combination has one such box. It is the aftmost box on that chord for which AIC arrays must be calculated and may be on the planform or diaphragm.

AIC - Aerodynamic Influence Coefficient

Area Ratio - On-planform fraction of a box which is cut by the planform boundary.

Apex Box - The box on the sending surface which encloses the apex of the Mach hyperbola associated with the receiving box.

Box Grid - Non-dimensionalized geometric array of boxes whose extent is determined by the geometric properties of the planforms. The term "grid" embraces the arrays on both surfaces.

Control Point - The location at which a receiving box is deemed to be influenced by other boxes. In general, the center of the receiving box.

Effective Area - A concept which relates entirely to the sub-division technique. It is composed of those boxes sufficiently close to the receiving box that their influence on it is large enough for the subdivision refinement to affect results significantly. The size has been arbitrarily set to include the N_{BOX}/N_S rows immediately ahead of the receiving box.

Global Co-ordinate System - An overall reference system of co-ordinates. For example, the airplane co-ordinate system $X \sim$ aft, $Y \sim$ right, $Z \sim$ up. $Y = 0$ at centerline of airplane.

Leading Edge Diaphragm - All diaphragms on which $\Delta\phi = 0$.

Local Co-ordinate System - A co-ordinate system lying in the plane of the surface. $x \sim$ aft, $y \sim$ root to right tip. $y = 0$ at center line of airplane.

Longitudinal Separation - Streamwise distance between the trailing edge of the wing and the leading edge of the tail, measured along the centerline.

GLOSSARY OF TERMINOLOGY

Mach Asymptote - The asymptote of the Mach hyperbola.

Mach Hyperbola - The intersection of the sending plane and the forward Mach cone of the receiving point. Since this is always non-dimensionalized, it is a rectangular hyperbola.

Map - A condensed description of a large amount of data which can be used to locate any desired data element. A map of a banded sparse matrix might consist of two numbers per row, the first being the first non-zero column of that row and the second being the band width for that row. The matrix itself could then be stored as band elements only.

Normal Offset - The l_c distance between the sending box and the receiving point.

Parallel Offset - The m_c distance between the sending box center and the receiving point.

Partial Box - A sending box which is cut by the Mach hyperbola but which is neither an apex box nor an edge box.

Planar A.I.C. - An A.I.C defined by the geometric relation between a sending box and receiving box which lies in the same plane. $C_{\bar{\nu}, \bar{\mu}, 0}$ only.

Receiving Box - In defining the relationship between two boxes the receiving box is the box which can be influenced by the other box.

Receiving Chord - Those receiving boxes which lie on the same chord. The receiving chord is significant in that all the boxes lying on it use AIC arrays which are a subset of those for the aftmost box lying on that chord.

Sending Box - In defining the relationship between two boxes, the sending box is the box which influences the other box (c.f. Receiving Box).

Spatial A.I.C. - An AIC defined by the geometrical relationship between two boxes which do not lie in the same plane. $C_{\bar{\nu}, \bar{\mu}, \bar{\lambda}}, V_{\bar{\nu}, \bar{\mu}, \bar{\lambda}}, W_{\bar{\nu}, \bar{\mu}, \bar{\lambda}}$.

GLOSSARY OF TERMINOLOGY

Sub-box - A member of the array of boxes formed when the grid of sensing boxes is subdivided. Note it refers to the small box which is a fraction of the large box, and not to a large box which has been subdivided.

Tail - The downstream surface.

Vertical Separation - The vertical distance between the center lines of the two surfaces. Positive if the second surface is above the first.

Wake Diaphragm - That part of the diaphragm where $\Delta P = 0$ due to the influence of a surface.

Wing - Upstream Surface - (E.g. a Canard could be referred to as a wing);

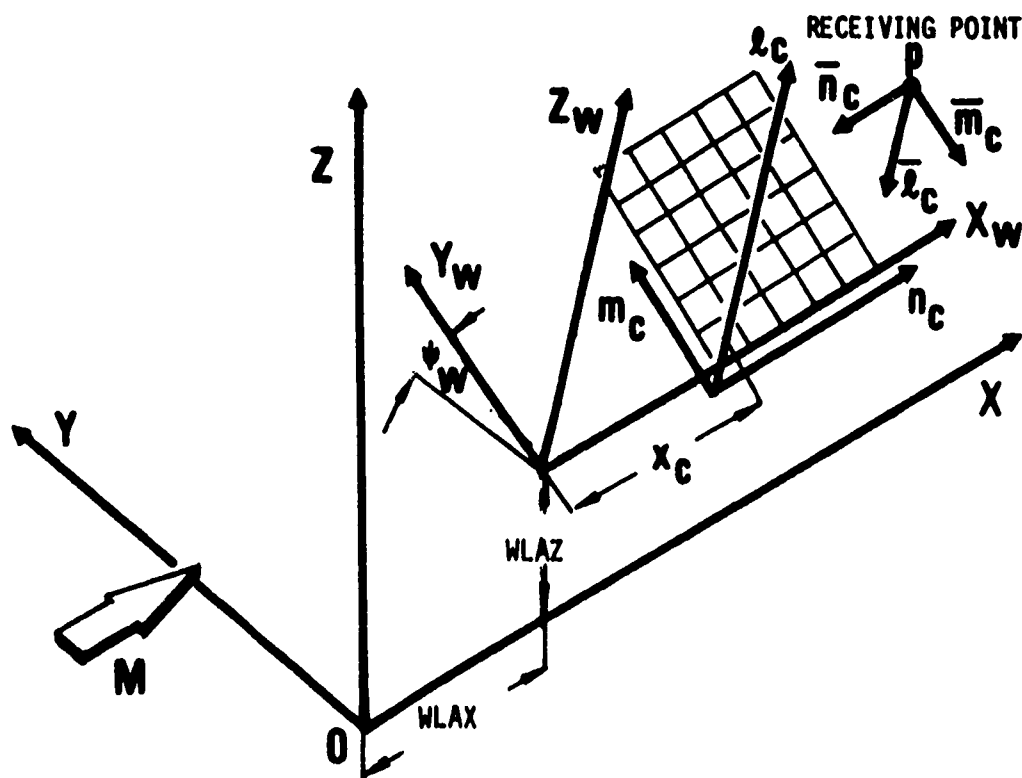

Figure 1 Coordinate Systems For A Right Wing

| Symbol | Transformation | Definition | Dimension |
|--|--|--|-----------------|
| X Y Z | Global or Reference Coordinate System. X positive Aft, Y positive Right, Z positive Upward | | Length |
| X _w Y _w Z _w | $X - WLAX$ $Y \cos \phi_w + (Z - WLAZ) \sin \phi_w$ $(Z - WLAZ) \cos \phi_w - Y \sin \phi_w$ | Wing Local Coordinate System, used to define wing leading and trailing edges. X_T, Y_T, Z_T are similarly defined for the tail local axes | Length |
| n _c m _c l _c | $(X_w - X_c) / b_1 + 1$ $Y_w / (b_1 / \beta) + 1/2$ $Z_w / (b_1 / \beta)$ | Sending Surface Coordinate System used to define box grid. The (n_c, m_c) plane lies within the plane of the sending surface, in this case the right wing. | Non-dimensional |

Figure 1 (Cont'd)

| Symbol | Transformation | Definition | Dimension |
|-------------------------|--|---|-----------------|
| n_c m_c l_c | $-(n_c - n)$ $-(m_c - m)$ $-(l_c - l)$ | Receiving Point Coordinate System parallel to the n_c, m_c, l_c coordinates but opposite in sign and having their origin at the pulse receiving point (n, m, l in the n_c, m_c, l_c coordinates) | non-dimensional |

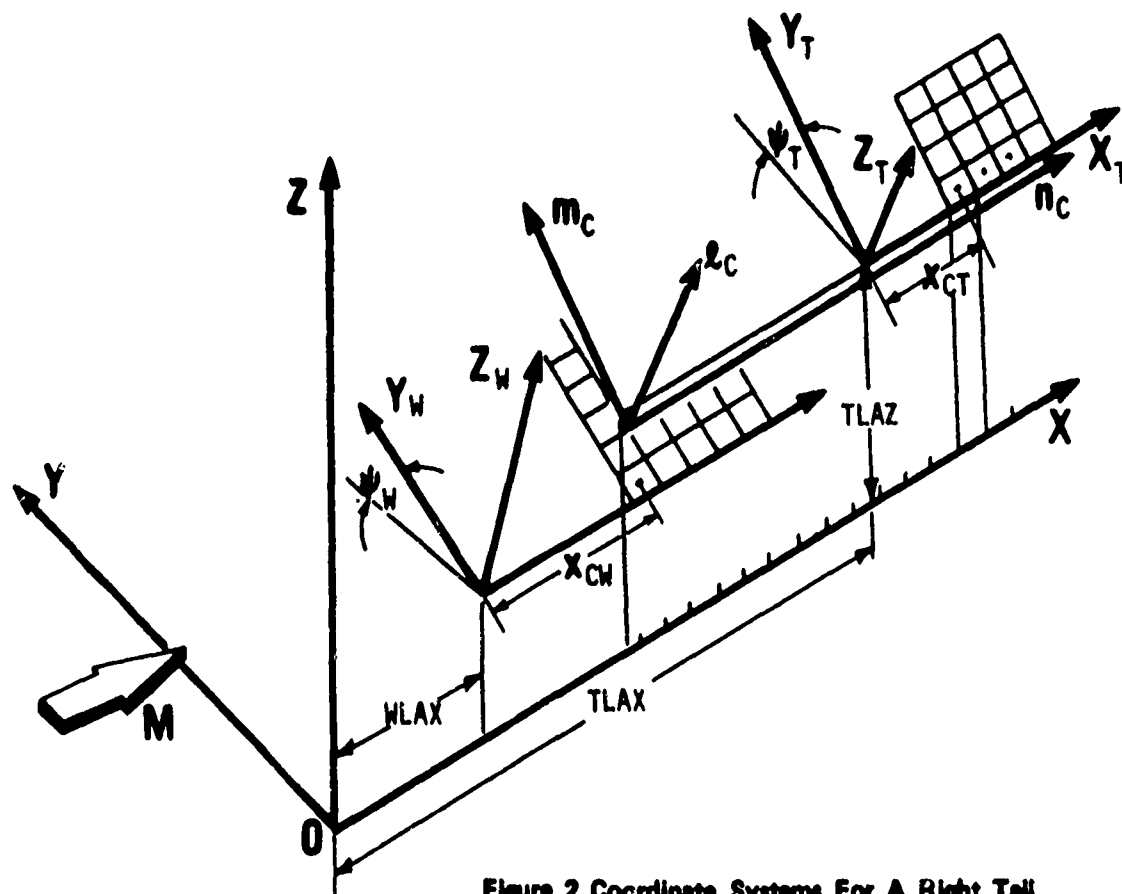

Figure 2 Coordinate Systems For A Right Tail

| SYMBOL | TRANSFORMATION | DEFINITION | DIMENSION |
|-------------------------|--|---|-----------------|
| X_T Y_T Z_T | $X - TLAX$ $Y \cos \psi_T + (Z - TLAZ) \sin \psi_T$ $(Z - TLAZ) \cos \psi_T - Y \sin \psi_T$ | Tail Local Coordinate System used to define tail leading and trailing edges. | length |
| n_c m_c p_c | $\{X_T + TLAX - (WLAX + X_C)\} / b_1 + 1$ $Y_T / (b_1 / \beta) + 1/2$ $Z_T / (b_1 / \beta)$ | Sending Surface Coordinate System. In this case the right tail is shown as the sending surface. | non-dimensional |

SECTION I

INTRODUCTION

Part II of this report describes the computer program written according to the analysis of Part I. Part II refers implicitly to Part I, Section III, Computer Program Usage, and material covered there is not repeated here. The program computes generalized unsteady air forces on a wing or wing and tail in supersonic flow, given geometric details of the surfaces and the oscillatory mode shapes of the surfaces. The surfaces may be coplanar, may have dihedral angles, and may be separated vertically. The Mach box technique may be used "straight", or three refinements may be applied: 1) Sub-division of the Mach boxes to improve velocity potentials, 2) Least-squares smoothing of calculated velocity potentials to eliminate roughness due to box representation of surface edges, 3) Piston theory correction for airfoil thickness. The refinements may be applied in any combination. As intermediate results, normal-washes, velocity potentials and wake sampling of upwash, sidewash and longitudinal washes may be printed, all at box center locations. The box lifts, pressure distribution, section lifts and total lift are also available for each mode.

SECTION II

COMPUTER PROGRAM DESCRIPTIONS

1. GENERAL DESCRIPTION

The computer program consists of a main (0,0) overlay, one primary level overlay, and eight secondary level overlays (see fig. (3)). The main (0,0) overlay is a general purpose driver, and easily can be used to incorporate other compatible programs with this one as a complete flutter system. Its sole function is to set up buffers and any other system oriented parameters, then call the primary level overlay, CONTROL.

Overlay CONTROL contains the basic logic of the program. It first calls secondary overlay DATAPP, which reads and processes the basic card data necessary for execution of the program. The resulting parameters are stored in labelled common blocks, accessible to all other overlays.

If PRVGEOM = .FALSE., overlay GEOMBX is next called. The planform geometry is read and processed to yield a disk file IGEOSC containing all internally necessary geometric parameters.

If PRVMODE = .FALSE., overlay CONTROL next calls overlay MODES. This area processes the three forms of modal data and places the results, evaluated at box centers, on scratch file MODESC.

Overlay CONTROL next enters a loop on reduced frequency. Each pass through the loop first executes overlay VICMAIN, which computes (or reads from previously saved tapes) all AIC arrays needed at the current reduced frequency. Next overlay NWVPMBX is called, to compute normal-washes, velocity potentials, and optional sample washes. If SMOOTH = .TRUE. overlay SMTH is called to do a least-squares surface fit of the resulting $\Delta\phi$ arrays. If CRDFIT = .TRUE. overlay CHORDF is called to smooth the $\Delta\phi$ values a chord at a time. The final overlay, FORCES, then computes box lifts, section lifts and generalized forces for any smoothed $\Delta\phi$ values first, then for the unsmoothed values. The desired results are printed as they are computed. The loop on reduced frequencies terminates at this point.

Overlay CONTROL reads the termination card which causes a transfer back to the execution of DATAPP (Recycle), the call of another overlay (if available), RETURN to the main (0,0) overlay, or EXIT to control cards.

The following sections give a more detailed description of all of the overlay main programs, and the major subroutines called by each.

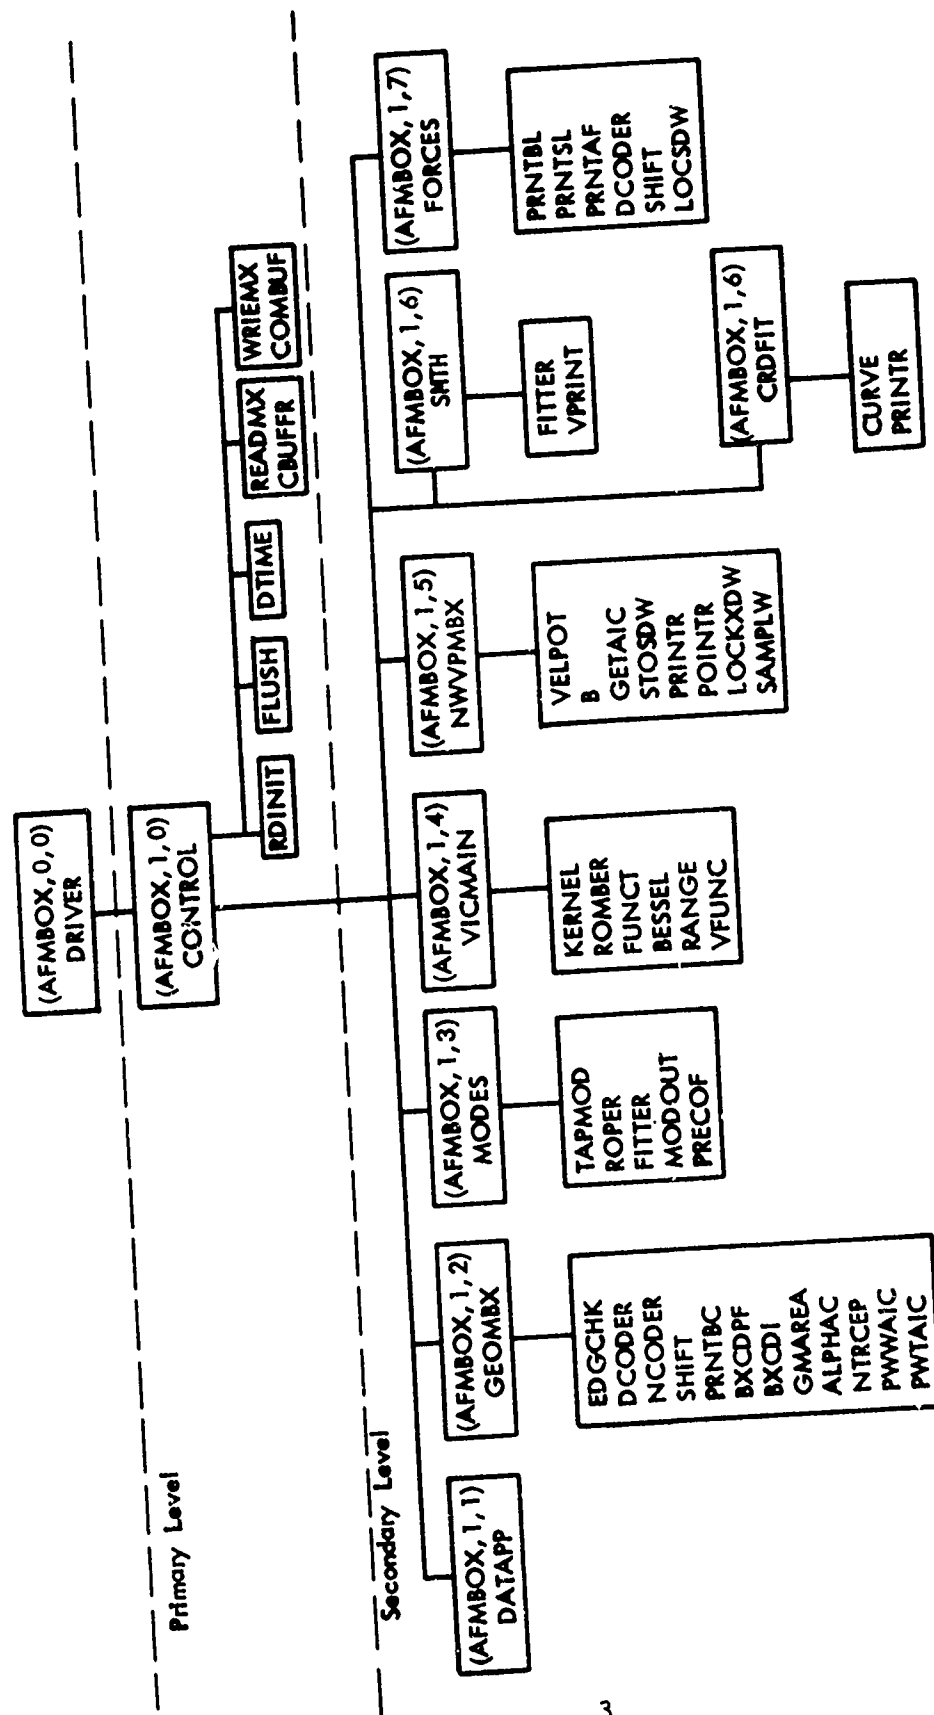

Figure 3 Program Overlay Structure

1. GENERAL PURPOSE SUBROUTINES

Fortran Callable COMPASS Function SHIFT

Author: G. E. Keylon

Purpose: To shift the contents of a word left or right a specified number of bits, identical to the Fortran Extended capability.

Method: The word and the number of bits to be shifted are stored in machine registers. The word is then left circular shifted the number specified. This causes the word to be shifted left circular if the number is positive and right with sign extension if the number is negative. The result is left in register X6 so that this routine must be used as a function subprogram.

Usage: INTEGER SHIFT

.
.
.
IWORD = SHIFT (NWORD,N)

Input

NWORD - The word to be shifted
N - The number to shift the word
If N is positive shift left circular.
If N is negative shift right with sign extension.

Output

IWORD has the results of the shift on NWORD.

Fortran Subprogram WRTEMX

Author: G. E. Keylon

Purpose: To write a matrix on a tape or disk file.

Method: The matrix is placed row-wise into a buffer in labelled common RWBUFF with all of the unused areas of its array omitted. The buffer is then written onto the specified tape or disk file with the Fortran BUFFER OUT statement. A 16 word header record is written in the same manner before each matrix. The header record contains matrix size, name and optional parameters.

Usage: CALL WRTEMX (IOUTFL, MXWRIT, RANDOU, NFS, NMS, LS, NMR, LWS, K, ID, A, ITYPE, M, N, PARM, IRR)

Input

IOUTFL - Tape number or left-justified file name.
MXWRIT - Logical variable, not used.
RANDOU - .T. Random File (not used)
 .F. Sequential File
NFS - Number of files to space before writing
NMS - Number of matrices to space before writing
LS - Level number to space (not used)
NMR - Name or number in random index (not used)
LWS - Level number of this matrix (not used)
K - Row dimension of array A.
 if K ≤ matrix is already in /RWBUFF/
ID - Array containing matrix nome.
A - Array containing matrix
ITYPE - TYPE of matrix (i.e., real, complex, integer, null, mixed)
M - Row dimension of matrix
N - Column dimension of matrix
PARM - 10-word parameter array

Output

IRR - Error return
 0, no error
 1, matrix spacing is negative
 2, File spacing is negative
 4, M*N dimensions greater than buffer size
 1500+I, encountered EOF after matrix I while skipping matrices.

Fortran Subprogram COMBUF

Author: G. E. Keylon

Purpose: To put a complex matrix into a buffer prior to writing on file.

Method: The matrix is placed row-wise into a buffer with all of the unused areas of the matrix omitted. All of the real parts are stored in the first part of the buffer then all of the imaginary parts are placed immediately following the real.

Usage: CALL COMBUF (A, K2, M, N, BUFF)

Input:

A - Array that contains matrix, typed complex
K2 - 2x (row dimension of A)
M - Number of rows in matrix (not array size)
N - Number of columns in matrix (not array size)

Output:

BUFF - Buffer that will contain matrix

Fortran Subprogram READMX

Author: G. E. Keylon

Purpose: To read a matrix from tape or disk file.

Method: A 16-word header record and a matrix record are read from the specified file with BUFFERIN statements. The 16-word header record contains matrix size, name and optional parameters. The matrix is then placed in a given array in correct Fortran storage.

Usage: CALL READMX(INFILE, MXREAD, RANDIN, NFS, NMS, LS, NMR, K, NID, ID, ITYPE, LRS, A, M, N, PARM, IRR)

Input:

INFILE - Tape number or left justified alphanumeric file name

MXREAD - Logical variable (not used)

RANDIN - .T. Random File (not used)
.F. Sequential File

NFS - Number of files to space before reading

NMS - Number of matrices to space before reading

LS - Level number to space (not used)

NMR - Random name or number (not used)

K - Row dimension of array A

If $K \leq 0$ matrix will be left in /RWBUFF/

NID - Number of words available in ID array

In/Out:

ID - Identification array

ITYPE - Real, diagonal, null, mixed, complex

Output:

LRS - Level number of matrix read (not used)

A - Array containing matrix

M - Row dimension of matrix

N - Column dimension of matrix

PARM - Array of numerical parameters stored with the matrix in the 16 word header record

IRR - Error return

0, no error

1, matrix spacing is negative

2, file spacing is negative

4, matrix dimensions illegal

5, $M > K$

1500 + I, encountered EOF after matrix I while skipping matrices.

Fortran Subprogram CBUFFER

Author: G. E. Keylon

Purpose: To move a complex matrix from a buffer to a Fortran array.

Method: The matrix assumed stored row-wise in the buffer with all of the real parts followed by all of the imaginary parts. The conversion leaves the matrix in the array in typical Fortran storage.

Usage: CALL CBUFFER(A,K2,M,N,BUFF)

Input:

K2 - 2x (row dimension of array A)
M - Number of rows in matrix (not array size)
N - Number of columns in matrix (not array size)
BUFF - Buffer that contains matrix

Output:

A - Array that will contain matrix in complex storage

3. MAIN CONTROL PROGRAM

Fortran Program CONTROL

Author: G. E. Keylon, G. D. Kramer

Purpose: To control the flow of the program to the various lower level overlay section.

Method: The program has all of the labeled common blocks so that information can be passed from lower levels to this program which will determine the program flow.

Usage: The CONTROL Program is a main routine. It is the only primary overlay section in the program. It calls all of the lower level or secondary overlay sections. It is called from the initial or main overlay section as follows:

```
CALL OVERLAY(6HAFMBOX, 1, 0, 0)
```

Common Input and Output:

This program does not input or create common values. It is the means by which common values are passed between the secondary overlays of the program.

4. DATA INPUT PROCESSOR

Fortran Program DATAPP

Author: G. E. Keylon

Purpose: To read most of the input data and set flags and options for use throughout the program. It prints the title and options for each run.

Method: The title and all the input options are read in. The heading is printed. The options are read under a NAMELIST format and flags set to default options unless read in.

Usage: The DATAPP program is the main program of a secondary overlay of the Mach Box program. It is called as an overlay section as follows:

```
CALL OVERLAY(6HAFMBOX, 1, 1, 0)
```

All input and output is through labeled common blocks.

Common Input:

```
PREVEX  
OMACH  
DEFAULT
```

Common Output:

| | | |
|---------|--------|--------|
| TITLE | ERR | SYM |
| PRVGEOM | XKUAL | MTYPEW |

5. GEOMETRY PROCESSOR

Fortran Program GEOMBX

Author: G. D. Kramer

Purpose: To read geometric data from cards and compute all necessary geometric parameters.

Method: Cards F through L are read in this section. As they are read they are printed, then checked for inconsistent or missing data, with suitable diagnostics. The leading and trailing edge data is checked in EDGCHK, then transformed to non-dimensional coordinates. Planform and diaphragm box code patterns are determined in BXCDPF and BXCDI, and optionally printed by PRNTBC. The fractional on-planform portion of all boxes cut by a planform edge is determined by GMAREA, which in turn calls ALPHAC and NTRCEP. If spatial AIC's are necessitated by non-zero dihedral angles or vertical separation of wing and tail, integer arrays MUAIC are determined for each AIC set (C,W,V). These serve as a map, so that only those AIC values needed will be calculated. The MUAIC arrays are computed in PWWAIC and PWTaic. All resulting arrays are written on scratch file IGEOsc.

Usage: The GEOMBX program is the main program of a secondary overlay. It is called by:

CALL OVERLAY (6HAFMBØX, 1, 2, 0)

Common Input:

| | |
|--------|--------|
| OMACH | NSUBDV |
| TITLE | NSURF |
| PRVGEO | MYBW |
| DIHW | PRBOX |
| DIHT | GEOCPR |
| XMACH | |

Common Output:

| | | | |
|--------|--------|--------|--------|
| COPLAN | MXBW | MXBT | FSMPLW |
| XSUBDV | MXBBW | MYBT | ICHORD |
| NSUBDV | MYBBW | MYBBT | IBOXF |
| NSUBD2 | MXBSW | MXBST | IBOXL |
| NSUBCN | MYBSW | MYBST | ZLOC |
| B1 | MYBBSW | MYBBST | |
| BLBETA | IXBW | IXBT | |
| B1S | XCENTR | IXBST | |
| B1BTAS | TLAX | CAPL | |

| | | |
|------|------|--------|
| WLAX | TLAZ | NSPATK |
| WLAZ | PSIT | |
| PSIW | | |

Arrays output on scratch file IGEOSC:

- IBOXW - Wing box codes (Wing and tail if
COPLAN = .TRUE.)
- IBOXT - Tail Box codes
- FEXLOC - Leading edge locations at chord centers
- TEXLOC - Trailing edge locations at chord centers
- ALPHA - Fractional areas of boxes cut by a
planform edge
- IJALPH - Locations of cut boxes, of the form
(1000*J+I)₈
- KPT - Table of contents for the MUAIC arrays
(and AIC's)
- MUAIC - Pointer array indicating where contri-
buting boxes will be found for one
spatial AIC set.

Fortran Subroutine EDGCHK

Author: G. D. Kramer

Purpose: Given the leading or trailing edge values, to check for illegal combinations.

Method: Either a leading or trailing edge is checked for monotonic increasing y-values, starting at zero. The last trailing edge value is compared with the previous last value. A leading edge is checked for monotonically increasing x-values.

Usage: DIMENSION XEDGE(10), YEDGE(10)
CALL EDGCHK (XEDGE, YEDGE, NEDGE, IEDGE, IRR)

Input Parameters:

XEDGE - Array of X-values for edge location points
YEDGE - Array of Y-values for edge location points
NEDGE - Number of points to check
IEDGE - =1, leading edge
 =2, trailing edge

Output Parameter:

IRR =0, Successful
 = 1, Non-monotonic y-values
 = 2, Non-monotonic x-values, leading edge only
 = 4, Y-values not starting at zero
 = 8, Tip y-values not agreeing
 Other, additive combination of above conditions

Fortran Subroutine BXCDPF

Author: G. D. Kramer

Purpose: To generate on-planform box codes for one surface, and store them in a compressed format.

Method: For each (subdivided) chord, the location of the leading edge and trailing edge (FEXLOC, TEXLOC) is determined. Codes for all boxes between those values are then set to 1 in subroutine NCODER. The remainder of the box code array is not changed.

Usage: The subroutine is called by:
CALL BXCDPF(XLE, YLE, NLE, XTE, YTE, NTE, LSROWS, IBOX)

Input Parameters:

$\begin{Bmatrix} XLE \\ YLE \end{Bmatrix} = \begin{Bmatrix} x \\ y \end{Bmatrix}$ locations of leading edge, measured in n_c, m_c, l_c system

$\begin{Bmatrix} XTE \\ YTE \end{Bmatrix} = \begin{Bmatrix} x \\ y \end{Bmatrix}$ locations of trailing edge, measured in n_c, m_c, l_c system

$\begin{Bmatrix} NLE \\ NTE \end{Bmatrix} =$ Number of $\begin{Bmatrix} \text{leading} \\ \text{trailing} \end{Bmatrix}$ edge definition points.

LSROWS = Maximum number of subdivided rows allowed.

In/Out Parameters:

$\begin{Bmatrix} IXBW \\ IXBT \end{Bmatrix} =$ Input: 0 indicates the $\begin{Bmatrix} \text{wing} \\ \text{tail} \end{Bmatrix}$ is to be done.

Output: Subdivided row of first unsubdivided box center on the surface.

Output Parameters:

IBOX Compressed box codes, 1 for on-planform boxes found, unchanged elsewhere. See Figure 4.

Output Common Parameters:

$\begin{Bmatrix} MXBS \\ MYBS \end{Bmatrix} \begin{Bmatrix} W \\ T \end{Bmatrix}$ Maximum $\begin{Bmatrix} X \\ Y \end{Bmatrix}$ (aft) extension of the subdivided $\begin{Bmatrix} \text{wing} \\ \text{tail} \end{Bmatrix}$ pattern

$\begin{Bmatrix} MXB \\ MYB \end{Bmatrix} \begin{Bmatrix} W \\ T \end{Bmatrix}$ Maximum $\begin{Bmatrix} X \\ Y \end{Bmatrix}$ (outward) extension of the subdivided on-planform $\begin{Bmatrix} \text{wing} \\ \text{tail} \end{Bmatrix}$ pattern

$\begin{Bmatrix} MXB \\ MYB \end{Bmatrix} \begin{Bmatrix} W \\ T \end{Bmatrix}$ Maximum $\begin{Bmatrix} X \\ Y \end{Bmatrix}$ extension of the unsubdivided $\begin{Bmatrix} \text{wing} \\ \text{tail} \end{Bmatrix}$ pattern

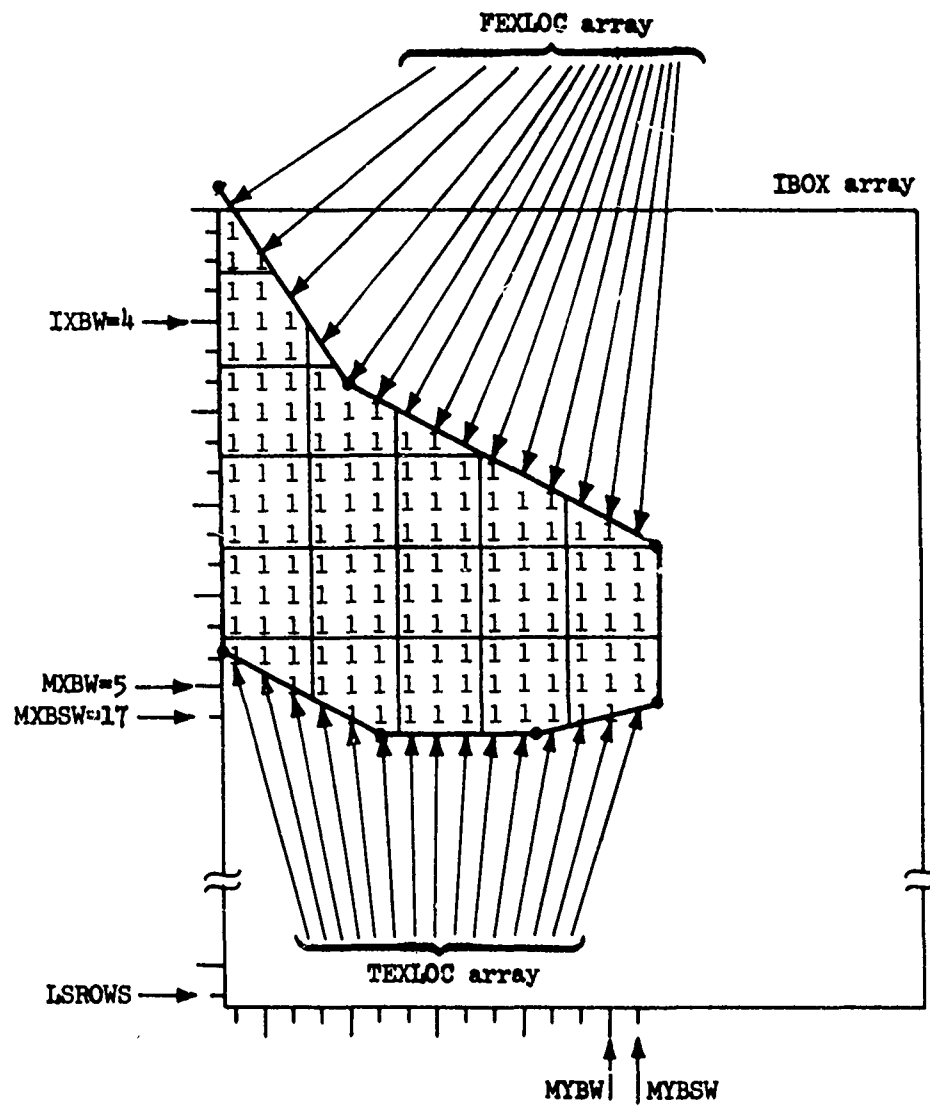

FIGURE 4 Output from BXCDPF, Called for a Wing (NSUBDV=3)

$MYB \begin{Bmatrix} W \\ T \end{Bmatrix}$ Maximum Y extension of the unsubdivided
 $\begin{Bmatrix} \text{wing} \\ \text{tail} \end{Bmatrix}$ pattern
 $\begin{Bmatrix} FEXLOC \\ TEXLOC \end{Bmatrix} = \begin{Bmatrix} \text{Leading} \\ \text{Trailing} \end{Bmatrix}$ edge X location at (subdivided)
 chord centers.

Fortran Subroutine BXCDI

Author: G. D. Kramer

Purpose: Given an array indicating a pattern of on-planform Mach boxes, to determine the associated off-planform diaphragm boxes

Method: Leading edge diaphragm boxes are first determined, followed by wake diaphragm boxes. The tip diaphragm is then determined as a function of the tip chord. For the wing, an integer array is interrogated to determine whether additional wake areas (and tip diaphragm) are needed for wing-tail interference.

Usage: The subroutine is called by:
CALL BXCDI (IWAKE, LSROWS, LSCHDS, IBOX)

Input Parameters:

IWAKE: Array of locations on the wing for aft-most unsubdivided box in each chord affecting a tail surface. Not used for the tail surface, first element = 0

LSROWS: Maximum number of subdivided rows allowed

LSCHDS: Maximum number of subdivided chords allowed

Input/Output

IBOX: Array of subdivided box codes, previously set 1 at planform locations by subroutine BXCDPF. See figure 5.

Common Input

MXBBSW } Maximum X extension of the subdivided {wing}
MXBBST } box pattern, including diaphragm {tail}

IXBST X-location of the first subdivided tail row

MYBSW } Maximum Y extension of the subdivided plan-
MYBST } form {wing} pattern {tail}

MYBBSW } Maximum Y extension of the subdivided {wing}
MYBBST } pattern, including diaphragm {tail}

NSUBDV Number of subdivisions

Common Output

MYBBSW } Modified, if necessary
MYBBST }

MYBSW } Maximum Y extension of the unsubdivided
MYBST } {wing} pattern, including diaphragm {tail}

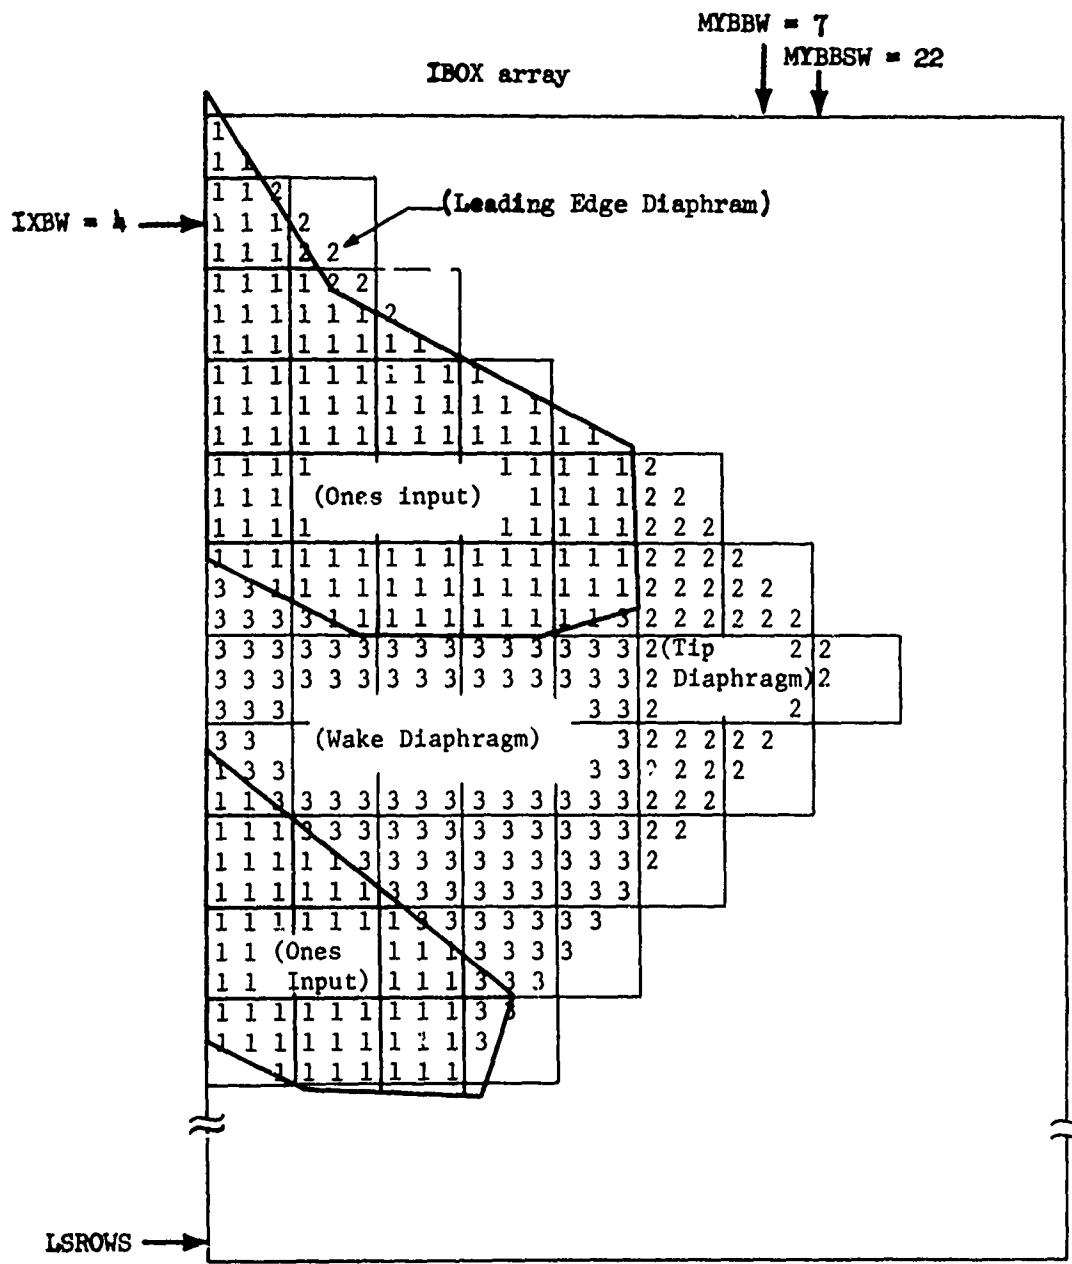

Figure 5 Output from BXCDI, called for a Coplanar Wing and Tail (NSUBDV = 3)

Fortran Subroutine PRNTBC

Author: G. D. Kramer, G. E. Keylon

Purpose: Print the array of box codes, either all values or only unsubdivided box-center values

Method: The compressed box code array is decompressed using subroutine DCODER, one row at a time, and printed. If unsubdivided codes have been requested, only the control point values are printed.

Usage: CALL PRNTBC (IBOX, LBXCD, IROW, MXB, MYB, SUBD)

- IBOX - Box code array
- LBXCD - Row size of box code array
- IROW - First row to print
- MXB - Last row to print
- MYB - Number of chords to print
- SUBD - .T., subdivided box codes desired
.F., unsubdivided (control point) box codes desired

Fortran Subroutine PWWAIC

AUTHOR: G. D. Kramer

PURPOSE: Given the box pattern and dihedral angle of the surface, to determine a pointer array (MUAIC) for one chord on the right surface which indicates contributing regions (if any) of the left surface on the given chord.

METHOD: The geometric relationship of the sending surface to the receiving chord is first determined. Then for all rows, from the last receiving box forward to the forward edge of the box pattern, any sending boxes on the left surface are indicated in the MUAIC array.

USAGE: CALL PWWAIC(WING,IBOX,LBXCD,IWAKE,JCOL)

Input Parameters:

WING .T., wing is being considered.
 .F., tail is being considered.

IBOX Array of box codes (IBOXW or IBOXT).

LBXCD Length of array IBOX.

IWAKE Array of locations of aft-most box to be considered on the wing. Ignored if WING = .F.

JCOL Chord being considered (receiving).

Common Input:

PSI $\begin{Bmatrix} W \\ T \end{Bmatrix}$ Dihedral angle

NSUBDV Number of subdivisions

XSUBDV Number of subdivisions, real

NSUBD2 NSUBDV/2

IXBW Location of first unsubdivided box center.

Output Parameters:

The computed results are returned via common block MUAICS. They are:

SURF Logical indicator - true means a sending surface was encountered.

MUAIC(2,50) Unsubdivided row "map" of sending box locations, see Figure 7.

EL Normal offset of receiving chord from sending surface.

YBAR Parallel offset of receiving chord.

NROWS Number of rows considered.

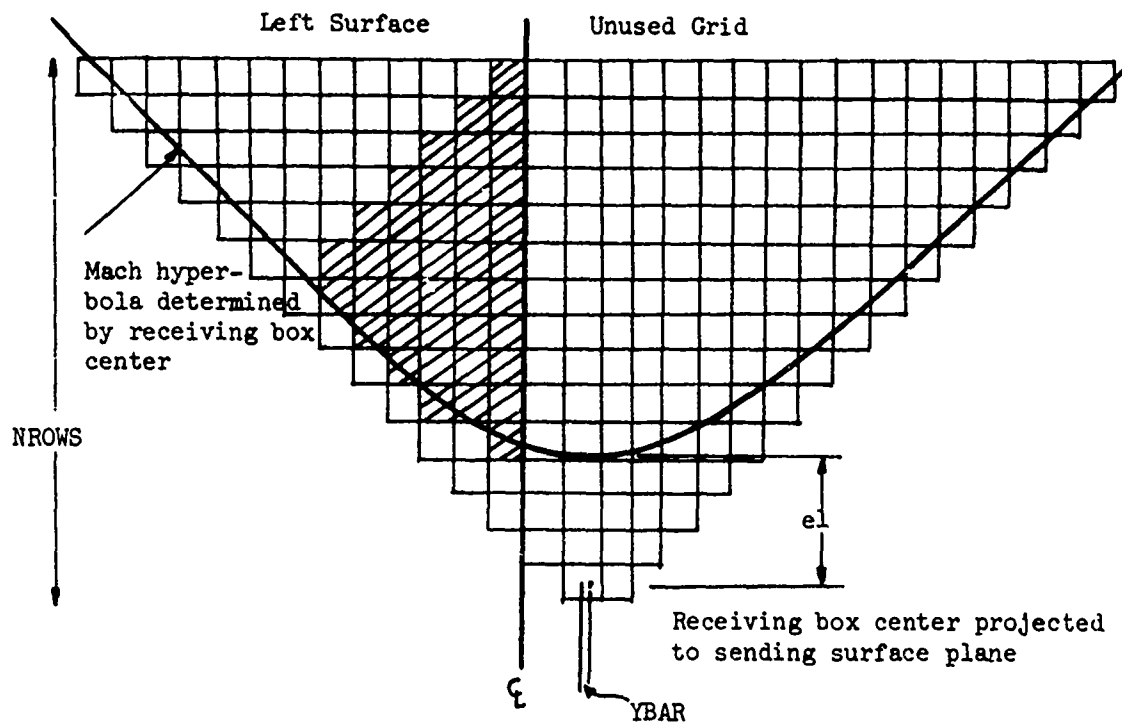

FIGURE 6. Possible Arrangement of Sending Boxes, Left Surface to Right
(Actual sending boxes shaded.)

NROWS = 15

FIGURE 7. MUAIC Array Generated by PWWAIC for Figure 4.

Fortran Subroutine PWTaic

Author: G. D. Kramer

Purpose: Given the box patterns and dihedral angles of the two surfaces, to determine pointer arrays (MJAIC arrays) for the right wing and the left wing contributing regions to a desired tail chord.

Method:] The geometric relationship of the sending surfaces to the receiving chord is first determined. Then for all rows, from the last receiving box forward to the forward edge of the sending box patterns, any sending boxes are indicated in the MJAIC arrays.

Usage: The subroutine is called, after suitable setup, by:
CALL PWTaic (IBOXW, LBXCDW, IROW, JCOL, CAPLL, YMUVSP)

Input Parameters:

IBOXW - Array of wing box codes
LBXCDW - Row dimension of IBOXW
IROW - Unsubdivided receiving row number
JCOL - Unsubdivided receiving chord number
CAPLL - Vertical Separation of sending center line
receiving center line
YMUVSP - $\bar{\mu}$ contribution due to vertical separation
= CAPLL * $\sin(\psi_w)$

Input Common Variables

PSIDIF = $\phi_r - \phi_w$ PSIT
NSUBDV FEXLOC
PSIW TEXLOC
MYBBW SYM
MYBSW
IXBW

Output Parameters

The computed results are returned via common block MJAICS. They are:

{SURF } = .T., Contributing boxes were found on the
{SURFL} {right } wing
{left }
= .F., No contributions were found

- $\begin{Bmatrix} \text{MUAIC} \\ \text{MUAICL} \end{Bmatrix}$. Map of contributing boxes on the $\begin{Bmatrix} \text{right} \\ \text{left} \end{Bmatrix}$ wing, see Figure 7.
- $\begin{Bmatrix} \text{EL} \\ \text{ELL} \end{Bmatrix}$ The normal offset between the wing $\begin{Bmatrix} \text{right} \\ \text{left} \end{Bmatrix}$ plane and the receiving point
- $\begin{Bmatrix} \text{YBAR} \\ \text{YBARL} \end{Bmatrix}$ The paralalled offset between the nearest chord center on the wing $\begin{Bmatrix} \text{right} \\ \text{left} \end{Bmatrix}$ box pattern and the receiving point
- $\begin{Bmatrix} \text{NROWS} \\ \text{NROWSL} \end{Bmatrix}$ Number of rows covered by the MUAIC array for the $\begin{Bmatrix} \text{right} \\ \text{left} \end{Bmatrix}$ wing contributions

Fortran Subroutine GMAREA

AUTHOR: G. E. Keylon, G. D. Kramer

PURPOSE: To compute the fractional on-planform portion of all planform boxes which are cut by a planform edge.

METHOD: For each chord, the X coordinates of the left side intercept, right side intercept, and any kinks within the box width are determined by subroutine NTRCEP for each planform edge cut by the chord (wing and/or tail). Then for each planform box on the chord, the routine determines whether any edge cuts the box or causes a contribution to the box area. For any affected box, subroutine ALPHAC is called to compute the fractional area, which is then stored in array ALPH, and its location is stored in array IJALPH as $(J * 512 + I)$. The fraction may be greater than one, since it includes the planform area of any chordwise adjacent box whose center is off planform.

USAGE: The routine is called by:

CALL GMAREA (IBOX, LBXCD, WING, ALPHA, IJALPH, NALPH)

Input Parameters:

IBOX Box code array
LBVCD Size of box code array
WING .T., Wing or coplanar case
.F., Tail

Input Common Parameters:

| | | | | |
|--------|--------|-------|------|------|
| COPLAN | MXBT | NSURP | XWLE | XTLE |
| FEXLOC | MXBW | NWLE | YWLE | YTLE |
| TEXLOC | MYBT | NWTE | XWTE | XTTE |
| IXBT | MYBW | NTLE | YWTE | YTTE |
| IXBW | NSUBDV | NTTE | | |

Output Parameters:

ALPHA Array of area multipliers
IJALPH Array of corresponding IJ locations, as $(J * 512 + I)$
NALPH Number of fractions calculated

Fortran Subroutine NTRCEP

AUTHOR: G. E. Keylon

PURPOSE: To compute the X coordinates of the intersections of a planform edge with the sides and center of a chord.

METHOD: The routine determines in which interval of the edge the desired point lies. The x-coordinate of the point is then obtained from the standard two point equation of a line. This is done for all three points.

USAGE: The routine is called by:

CALL NTRCEP (J, YEDG, XEDG, L1, C1, R1, NBK1, K1, IDEX)

Input Parameters:

J = Chord number
YEDG } = Arrays of $\begin{Bmatrix} Y \\ X \end{Bmatrix}$ locations of the edge definition points
XEDG }
IDEX = 1, leading edge
 2, trailing edge

Common Input Values (from local common block/LAREA/)

LEFT = Y-location of the left side of the chord
RIGHT = Y-location of the right side of the chord

Output Parameters

L1 = X coordinate of left side intersection
C1 = X coordinate of center line intersection
R1 = X coordinate of right side intersection

NBK1 = Number of edge definition points encountered between the left and right sides of the chord.

K1 = 0 if no edge definition point lies between the left and right sides of the chord.

= The first (leftmost) edge definition point number lying within the chord.

Subroutine ALPHAC

AUTHOR: G. E. Keylon, G. D. Kramer

PURPOSE: To compute the on-planform area of a box which is partially off the planform or which must include area from neighboring off-planform box(es) cut by a planform edge.

METHOD: If the box is the first box on the chord, or the last box on the chord, the box is divided spanwise into a series of trapezoids (or triangles) determined by planform edge definition points occurring within the chord. The areas of these trapezoids are then added, yielding α .

If the box is an interior box which is cut by one or more planform edge segments, the area is first set to one, then the area of the off-planform corner(s) determined as trapezoids or triangles is subtracted.

USAGE: The routine is called by

CALL ALPHAC (X, XLED, YLED, XTED, YTED, L1, C1, R1, NBK1, K1,
L2, C2, R2, NBK2, K2, AREA)

Input Parameters:

X = X coordinate of box center
XLED } = Planform leading edge definition points
YLED }
XTED } = Planform trailing edge definition points
YTED }
L1 } = { Left }
C1 } = { Center } Chord edge intersections with the planform
R1 } = { Right } leading edge
NBK1 = Number of planform leading edge definition points within the chord
K1 = First leading edge definition point within chord
L2 }
C2 } Same as above for trailing edge
R2 }
NBK2 }
K2 }

Output Value:

AREA = The desired box area, α

6. MODAL DATA PROCESSOR

Fortran Program MODES

AUTHOR: G. E. Keylon

PURPOSE: To read the modal input data, compute it by a least squares surface fitting routine or evaluate a polynomial equation with coefficients supplied by input and store this information on a scratch file.

METHOD: The information needed to determine the mode shapes is read in. The planform information is read from a scratch file created in the geometry section. The program then computes or reads the modal data at control points, orders the data and writes the data on a scratch file for use in following sections.

Subroutine ROPER is used to compute row pointers for storing box center modal values row-wise. Modal input from tape is handled by TAPMOD. If modal input option 2 was specified, FITTER is called to compute the surface fit polynomial coefficients. PRECOF is called if the coefficients from option 1 or 2 are to be printed. The coefficients are saved on a scratch file for future cycles, and the polynomial is evaluated at box centers, with the results stored on scratch file MODESC.

The program also has an option to read an array of Thickness slope function values derived from "Piston Theory" calculations. These values are input to an equation that computes the thickness correction factor.

$$\bar{Z}_\tau(x, y) = 1 + \frac{\gamma + 1}{2} \cdot M \frac{\partial z_\tau}{\partial x} \quad (1)$$

where γ is ratio of specific heats for a perfect gas (1.40)

M is Mach number.

$\partial z_\tau / \partial x$ is the thickness slope function values.

$\bar{Z}_\tau(x, y)$ is the thickness correction factor.

Input Methods:

(1) Polynomial Coefficient Input

The degree of a surface polynomial equation and the coefficients are read in. The deflection is then computed by the following polynomial equation:

$$\text{Deflection} = a_{00} + \sum_{i=1}^{\text{\# of degrees}} (a_{i0} x^i y^0 + \dots + a_{0i} x^0 y^i) \quad (2)$$

where, point (X,Y) is the coordinates of a box center in the planform local coordinate system, and a is the array of polynomial coefficients read in. The slope is computed by taking the derivative of the deflection in the X direction.

$$\begin{aligned} \text{Slope} &= \sum_{i=0}^{\text{\# of degrees}} d(a_{i0} x^i y^0 + \dots + a_{0i} x^0 y^i) / dx \\ &= \sum_{i=1}^{\text{\# of degrees}} (i a_{i0} x^{i-1} y^0 + \dots + a_{0i} y^i) \end{aligned} \quad (3)$$

These equations are used to compute the deflection and slopes for all the planform boxes. The array of modal values is stored on a scratch file for use in the velocity potential and generalized forces sections of the program.

(2) Interpolation

The degree of a surface polynomial equation, the number of locations where deflections are to be given and the locations and deflections are read in. The deflections are perpendicular to the surface and the (X,Y) locations are input in the planform local coordinate system. The program uses this data to fit a surface polynomial expression in the least squares error approximation. The routine that performs the surface fit is subroutine FITTER. This routine sets up an upper triangular, augmented matrix that represents the set of simultaneous linear equations formed by taking the partial derivatives of each deviation equation squared and setting it to zero. It then solves the set of simultaneous linear equations by using the Choleski square root method given in Reference 1. The solution is an array of polynomial coefficients that are used to compute the modal values in the same manner as method (1).

(3) Modal Values at Box Centers

The values of the deflections and slopes are read in from cards or tape and stored on a scratch file for use in the velocity potential and generalized forces sections of the program. The values are stored in order of boxes within chord, and chords within planform. The order is fore to aft boxes, center most to tip chord and wing before tail. For card input, each chord begins on a new card. All of the mode shape for the wing will be read followed by all of the mode shapes for the tail.

USAGE:

The MODES program is the main program of a secondary overlay of the Mach Box program. It is called as follows:

CALL OVERLAY (6HAFMBØX, 1, 3, 0)

Input:

Uses labeled common blocks:

/PROBLM/
/GEOMTY/
/GEOM2/
/FILES/
/IOCONT/
/TAPEIO/
/MODES/
/RWBUFF/

Uses the following files:

IGEOSC

Output:

Output is stored on file:

MODESC

Fortran Subprogram ROPER

AUTHOR: G. E. Keylon

PURPOSE: To compute the row pointers indicating location of planform boxes.

METHOD: The subprogram uses the column pointers and determines the row pointers. The subprogram will also calculate pointers for a tail surface with overlapped planform and store the pointers after the first planform pointers.

USAGE: CALL ROPER

General labeled common blocks used:

/GEOMTY/
/GEOM2/

LOCAL labeled common blocks used:

/INDEX/ IS(100), NOC(100), JS(50), JOC(50)

Common Input:

IS(J) - The ith index of the first planform box on chord J.

NOC(J) - The number of planform boxes on chord J.

Common Output:

JS(I) - The jth index of the first planform box on row I.

JOC(I) - The number of planform boxes on row I.

Fortran Subprogram FITTER

AUTHOR: G. E. Keylon

PURPOSE: To fit a surface in the least squares sense through a set of data points.

METHOD: The fitter routine is passed a set of ordered triplets and the degree of polynomial to fit. It is also given a scale factor if needed to scale the data to prevent the occurrence of arithmetic overflow or underflow. The program can fit real or complex data. The system of simultaneous linear equations that must be solved for employs the Choleski square root method (see Ref. 1). If the polynomial exceeds the maximum capability in either X or Y direction that degree is held and the other direction is allowed to use the full degree.

USAGE: CALL FITTER (M, N, X, Y, Z, C, CN, IDIM)

Input:

M - degree of polynomial equation
N - number of data points to fit curve through
X - Array of X coordinates
Y - Array of Y coordinates
Z - Array of Z coordinates
CN - scale factor
IDIM - Indicator of real or complex function
= 1, function to fit is real
2, function to fit is complex

Output:

C - Output polynomial coefficient array.

Fortran Subprogram MODOUT

AUTHOR: G. E. Keylon

PURPOSE: To print the mode shapes in a manner that the user can readily determine Mach box values of deflections and slopes.

METHOD: The mode shapes are rearranged in a print array so that one row or part of a row will be printed at a time. If there are more than 15 chords on the planform the program prints information for 15 chords, for all rows, and then prints for the next 15 chords until all information has been printed. The values may be scaled before printing to allow values to be printed under F mode Fortran format control. The scaling factor will be indicated in the title.

USAGE: CALL MODOUT (DEFSL, JS, JOC, NROWS, NM, IOVLAP)

Input:

DEFSL - Array of mode shapes
DEFSL(1,I) = deflection
DEFSL(2,I) = slope
JS - Array of pointers to first planform box on each row
JOC - Array of counters for the number of planform boxes on each row.
NROWS - number of rows
NM - Mode shape number
IOVLAP - Number of boxes of overlap between planforms for non-coplanar surfaces.

Output:

None

Fortran Subprogram PRECOF

AUTHOR: G. E. Keylon

PURPOSE: To print the polynomial coefficients used in evaluating mode shapes.

METHOD: The coefficients are printed with each coefficient having over it the corresponding powers of X and Y labeled. All the coefficients for a total power will on one line (i.e., line 1 - 0 power, line 2 - first power, line 3 - second power etc.).

USAGE: CALL PRECOF(IDEQ, A, IFR)

Input:

Labeled common block /FILES/

IDEQ - Degree of polynomial equation

A - Array of coefficients

IFR - Flag indicating how coefficients are obtained.

= 1, read from cards

= 2, computed by least squares surface fit.

Output:

None

7. AERODYNAMIC INFLUENCE COEFFICIENTS SECTION

Fortran Program VICMAIN

AUTHOR: G. E. Keylon

PURPOSE: To determine all aerodynamics influence coefficients (AIC's) that must be computed or retrieved for a specified reduced frequency.

METHOD: A parameter array is read from the geometry scratch file for each spatial AIC that is needed. The program then determines if an array already exists on permanent tape storage. If it exists the array is read in, expanded if necessary, and stored on scratch file IAICSC if spatial, or in blank common if planar. If calculation is necessary, subroutine KERNEL is called to control the actual computations. KERNEL in turn calls ROMBER to do the integrations of FUNCT and VFUNC.

USAGE: The VICMAIN program is the main program of a secondary overlay of the Mach Box program. It is called as follows:

CALL OVERLAY (6HAFMBØX 1, 4, 0)

Input:

Uses labeled common blocks

/KERN/
/KVAL/
/PROBLM/
/FILES/
/GEOMTY/
/IOCONT/
/ARRAYS/
/RWBUFF/
/TAPEIO/

Uses the following files

IGEOSC, OSPAIC (optional), OPLAIC (optional)

Output:

Output is stored on files:

NPLAIC, NSPAIC, IAICSC (all optional)

Fortran Subprogram KERNEL

AUTHOR: G. E. Keylon

PURPOSE: To determine the boxes to be integrated and the limits of integration prior to calling the integration routine.

METHOD: The program determines from a parameter array from the geometry scratch file, the intersection of the Mach cone with the planform boxes it is attempting to integrate. It determines what boxes on a row are to be integrated and breaks each box up into a set of integrable limits. It then passes the limits of integration to subroutine ROMBER for integration by the Romberg integration method described in Reference 2.

Box Patterns and Limits:

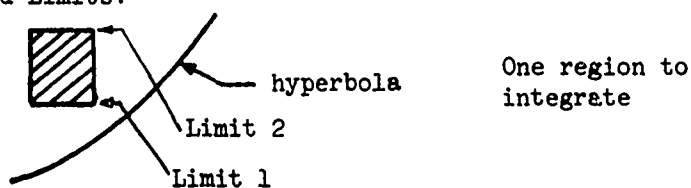

FIGURE 8 AIC Integration, Full Box

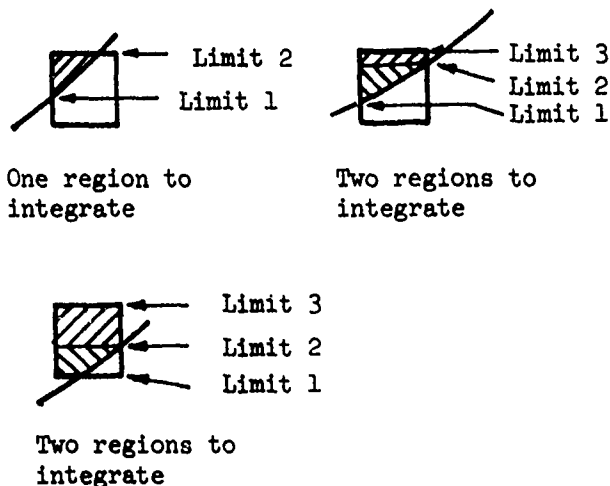

FIGURE 9 AIC Integration Edge Boxes

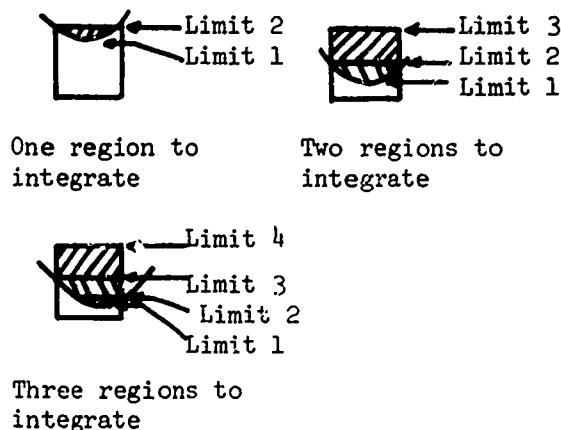

FIGURE 10 AIC Integration Apex Boxes

Box patterns and limits for boxes cut on the left side by the Mach hyperbola are computed in a like manner.

The functions integrated by subroutine ROMBER are those for the velocity potential aerodynamic influence coefficients ($C_{\bar{v}\bar{\mu}\bar{\lambda}}$), the upwash aerodynamic influence coefficients ($W_{\bar{v}\bar{\mu}\bar{\lambda}}$), and the sidewash aerodynamic influence coefficients ($V_{\bar{v}\bar{\mu}\bar{\lambda}}$).

The equations for $C_{\bar{v}\bar{\mu}\bar{\lambda}}$ and $W_{\bar{v}\bar{\mu}\bar{\lambda}}$ are:

$$C_{\bar{v}\bar{\mu}\bar{\lambda}} = -\frac{1}{\pi} \int_{\bar{\xi}_L}^{\bar{\xi}_u} e^{-i\bar{k}_1 \bar{\xi}} \left\{ J_0 \left(\frac{\bar{k}_1}{M} \sqrt{\bar{\xi}^2 - \ell^2} \right) \left[\sin^{-1} \left(\frac{\bar{\eta}_u}{\sqrt{\bar{\xi}^2 - \ell^2}} \right) \right. \right. \\ \left. \left. - \sin^{-1} \left(\frac{\bar{\eta}_L}{\sqrt{\bar{\xi}^2 - \ell^2}} \right) \right] + \sum_{r=1}^{\infty} \frac{(-1)^r}{r} J_{2r} \left(\frac{\bar{k}_1}{M} \sqrt{\bar{\xi}^2 - \ell^2} \right) \right. \\ \left. \left[\sin \left(2r \sin^{-1} \left(\frac{\bar{\eta}_u}{\sqrt{\bar{\xi}^2 - \ell^2}} \right) \right) - \sin \left(2r \sin^{-1} \left(\frac{\bar{\eta}_L}{\sqrt{\bar{\xi}^2 - \ell^2}} \right) \right) \right] \right\} d\bar{\xi}$$

$$\begin{aligned}
W_{\bar{\rho}, \bar{\mu}, \bar{\lambda}} = & \frac{\lambda}{\pi} \left[\int_{\bar{\xi}_L}^{\bar{\xi}_U} e^{-i\bar{k}_1 \bar{\xi}} \left\{ J_0 \left(\frac{\bar{k}_1}{M} \sqrt{\bar{\xi}^2 - \ell^2} \right) \left[\sin^{-1} \left(\frac{\bar{\eta}_U}{\sqrt{\bar{\xi}^2 - \ell^2}} \right) - \right. \right. \right. \\
& \left. \left. \sin^{-1} \left(\frac{\bar{\eta}_L}{\sqrt{\bar{\xi}^2 - \ell^2}} \right) \right] + \sum_{r=1}^{\infty} \frac{(-1)^r}{r} J_{2r} \left(\frac{\bar{k}_1}{M} \sqrt{\bar{\xi}^2 - \ell^2} \right) \cdot \right. \\
& \left. \left[\sin \left(2r \sin^{-1} \left(\frac{\bar{\eta}_U}{\sqrt{\bar{\xi}^2 - \ell^2}} \right) \right) - \sin \left(2r \sin^{-1} \left(\frac{\bar{\eta}_L}{\sqrt{\bar{\xi}^2 - \ell^2}} \right) \right) \right] \right\} \frac{1+i\bar{k}_1 \bar{\xi}}{\bar{\xi}^2} d\bar{\xi} \\
& + \left| \frac{e^{-i\bar{k}_1 \bar{\xi}}}{\bar{\xi}} \left\{ J_0 \left(\frac{\bar{k}_1}{M} \sqrt{\bar{\xi}^2 - \ell^2} \right) \left[\sin^{-1} \left(\frac{\bar{\eta}_U}{\sqrt{\bar{\xi}^2 - \ell^2}} \right) - \sin^{-1} \left(\frac{\bar{\eta}_L}{\sqrt{\bar{\xi}^2 - \ell^2}} \right) \right] \right. \right. \\
& + \sum_{r=1}^{\infty} \frac{(-1)^r}{r} J_{2r} \left(\frac{\bar{k}_1}{M} \sqrt{\bar{\xi}^2 - \ell^2} \right) \left[\sin \left(2r \sin^{-1} \left(\frac{\bar{\eta}_U}{\sqrt{\bar{\xi}^2 - \ell^2}} \right) \right) \right. \\
& \left. \left. - \sin \left(2r \sin^{-1} \left(\frac{\bar{\eta}_L}{\sqrt{\bar{\xi}^2 - \ell^2}} \right) \right) \right] \right\} \right]_{\bar{\xi}_L}^{\bar{\xi}_U} + e^{-i\bar{k}_1 \bar{\xi}} \frac{\pi}{\ell} \quad (5)
\end{aligned}$$

The $C_{\bar{\rho}, \bar{\mu}, \bar{\lambda}}$ equations is valid for all types of boxes, which are shown in Figures 8, 9, and 10. The $W_{\bar{\rho}, \bar{\mu}, \bar{\lambda}}$ equation, as written, is valid for the region of an apex box shown in Figure 10, that has the hyperbola as a boundary on both sides. The last term is zero for regions that have the hyperbola as a boundary for one side and the box edge as the other side boundary. The last term and the terms evaluated at the integration limits are zero for full boxes or regions bounded on both sides by the box edges. The values of the integrand used in ROMBER are computed by subroutine FUNCT which also calls subroutines RANGE and BESSEL to evaluate the Bessel functions.

The function $V_{\bar{\rho}, \bar{\mu}, \bar{\lambda}}$ is considerably different and holds for all regions to be integrated. The evaluation of the integral is done by subroutine VFUNCT. The equation is:

$$v_{\bar{\nu}\bar{\mu}\bar{\lambda}} = -\frac{M}{\pi \bar{k}_1} \left[\left| \frac{-i\bar{k}_1\bar{\xi}}{\bar{\xi}} \frac{1+i\bar{k}_1\bar{\xi}}{\bar{\xi}^2} \left(\sin\left(\frac{\bar{k}_1}{M}\sqrt{\bar{\xi}^2 - \bar{\eta}_u^2 - l^2}\right) \right. \right. \right. \\ \left. \left. - \sin\left(\frac{\bar{k}_1}{M}\sqrt{\bar{\xi}^2 - \bar{\eta}_L^2 - l^2}\right) \right) \right]_{\bar{\xi}_L}^{\bar{\xi}_u} + \int_{\bar{\xi}_L}^{\bar{\xi}_u} \left[e^{-i\bar{k}_1\bar{\xi}} \frac{1+i\bar{k}_1\bar{\xi}}{\bar{\xi}^2} \right. \\ \left. \left(\sin\left(\frac{\bar{k}_1}{M}\sqrt{\bar{\xi}^2 - \bar{\eta}_u^2 - l^2}\right) - \sin\left(\frac{\bar{k}_1}{M}\sqrt{\bar{\xi}^2 - \bar{\eta}_L^2 - l^2}\right) \right) \right] d\bar{\xi} \quad (6)$$

For cases where $\bar{k}_1 = 0$, the equation becomes

$$v_{\nu\mu\lambda} = -\frac{1}{\pi} \left[\cosh^{-1} \frac{\bar{\xi}}{\sqrt{\bar{\eta}_u^2 + \bar{\lambda}^2}} - \cosh^{-1} \frac{\bar{\xi}}{\sqrt{\bar{\eta}_L^2 + \bar{\lambda}^2}} \right] \left[\right]_{\bar{\xi}_L}^{\bar{\xi}_u} \quad (7)$$

USAGE: CALL KERNEL(XMACH,K1,ERR,C,W,V)

Input:

XMACH Mach number
K1 Reduced frequency
ERR Convergence criteria (relative not absolute)
Labeled Common Block /VICPAR/

Output:

C Velocity potential aerodynamic influence coefficients.
W Upwash aerodynamic influence coefficients.
V Sidewash aerodynamic influence coefficients.

Fortran Subprogram ROMBER

AUTHOR: G. E. Keylon

PURPOSE: To integrate the aerodynamic influence coefficient functions.

METHOD: The program uses the Romberg integration technique (Ref. 2). The technique is a modified trapezoidal area method with an extrapolation method added. For analytical cases the sidewash aerodynamic influence coefficient will be solved by an analytic equation, not by numerical approximation.

USAGE: CALL ROMBER (XILL, XILU, IUC, ERR, IFLAG, K1BAR, YMUBAR, EL, XMACH
C, W, V)

Input:

XILL - Lower limit of integration
XILU - Upper limit of integration
IUC - Flag indicating type of box or edge condition of interval to be integrated = 0, full box
1, left side of box is edge of Mach hyperbola.
2, right side of box is edge of Mach hyperbola.
3, both sides of box are edges of Mach hyperbola.

ERR - Convergence criteria (relative, not absolute)
IFLAG - Indicator of real or imaginary parts
= 0, real part
= 1, imaginary part
K1BAR - Function of reduced frequency and Mach number, $= \frac{K_1 M^2}{(M^2 - 1)}$

YMUBAR - Parallel offset of pulse sending box.
EL - Normal offset of receiving point from sending plane.
XMACH - Mach number

Output:

C - Velocity potential aerodynamics influence coefficient, $C_{\bar{v}\bar{\mu}\bar{\lambda}}$
W - Upwash aerodynamic influence coefficient, $W_{\bar{v}\bar{\mu}\bar{\lambda}}$
V - Sidewash aerodynamic influence coefficient, $V_{\bar{v}\bar{\mu}\bar{\lambda}}$

Fortran Subprogram FUNCT

AUTHOR: G. E. Keylon

PURPOSE: To evaluate the velocity potential and upwash aerodynamic influence coefficient functions for a set of independent variables.

METHOD: An array XI of independent variables is passed to the program through the calling sequence. The program evaluates the function at each point first checking for boundary conditions where the function approaches a singularity. Routines to find the range of and value of Bessel functions are called in the evaluation of the function.

USAGE: CALL FUNCT (K, XI, FXIC, FXIW, IFLAG, KIBAR, EL, YMUBAR, IUC, XMACH, BESSY)

Input:

K - Number of functions to evaluate
XI - Array of independent variables
IFLAG - Indicator of real or imaginary part:
= 0, real part
= 1, imaginary part
KIBAR - Function of reduced frequency and Mach number, $K, M^{\infty} / (K^2 - 1)$
EL - Normal offset of receiving point from sending plane.
YMUBAR - Parallel offset of pulse sending box.
IUC - Flag indicating type of box or edge condition of interval to be integrated.
XMACH - Mach number

Output:

FXIC - Function values for Velocity Potential AIC.
FXIW - Function values for Upwash AIC.
BESSY - Evaluation at end points for upwash AIC.

Fortran Subprogram BESSEL

AUTHOR: G. E. Keylon

PURPOSE: To evaluate the Bessel functions for a given argument over a range of orders.

METHOD: The argument and range (# of terms or order) is passed to the routine. The routine then calculates the required terms and places them in an array and returns.

USAGE: CALL BESSEL (K12, AV, NA)

Input:

K12 - The argument, a function of independent variable, Mach number and reduced frequency.

NA - Highest order of the Bessel function to be evaluated.

Output:

AV - Array containing the Bessel functions.

Fortran Subprogram RANGE

AUTHOR: G. E. Keylon

PURPOSE: To determine the range (or order) of a Bessel function with a given argument.

METHOD: An order, or equation for an order, is given for various increments of arguments. This routine determines which interval the argument is in and computes the order.

USAGE: CALL RANGE (K12, NA)

Input:

K12 - The argument, function of independent variable, Mach number and reduced frequency.

Output:

NA - Highest order of the Bessel function to be evaluated.

Fortran Subprogram VFUNC

AUTHOR: G. E. Keylon

PURPOSE: To evaluate the sidewash aerodynamic influence coefficient function for a set of independent variables.

METHOD: An array of independent variables is passed to the program through the calling sequence. The program evaluates the function at each point, first checking for boundary conditions where the function approaches a singularity.

USAGE: CALL VFUNC (K, XI, FXIV, IFLAG, K1BAR, EL, YMUBAR, INC, XMACH, IND, VT)

Input:

K - Number of values to calculate
XI - Array of independent variables
IFLAG - Flag indicating real or complex part
= 0, real part
= 1, imaginary part
K1BAR - Function of reduced frequency and Mach number, $K_1 M^2 / (M^2 - 1)$
EL - Normal offset of receiving box above sending plane.
YMUBAR - Parallel offset of pulse sending box.
INC - Flag indicating type of box or edge condition of interval to be integrated.
XMACH - Mach number
IND - Indicator to calculate VT terms
= 0, do not calculate
= 1, calculate

Output:

FXIV - Function values for sidewash AIC.
VT - Extra terms calculated at the limits of integration.

8. NORMAL-WASHES AND VELOCITY POTENTIALS

Fortran Program NWLPT

AUTHOR: G. D. Kramer

PURPOSE: To compute normal washes and associated velocity potentials for each oscillatory mode shape at box centers. Wake sampling of upwash, sidewash and longitudinal wash is also provided.

METHOD: The necessary box patterns and other geometric items are first read in from the scratch file IGEOSC. The mode shape and velocity potential pointer array IPNTRM is read from scratch file MODESC, and a pointer array for normal-washes, IPNTDW, is generated by subroutine POINTR. These pointer arrays serve to associate a box location in a sparsely filled rectangular array with the corresponding mode, velocity potential or normal wash value in a singly dimensioned, densely filled array.

A loop on mode shapes is entered next. The box center deflections and shapes are read from MODESC into array DEFSL. Subroutine VELPOT is called for the wing to compute N_{RUW} , N_{RLW} , and $\Delta\bar{\phi}$ at box centers, and trailing edge $\Delta\bar{\phi}$ values in array TVP. If a tail is being analyzed as well, the contributing wing normal-washes are determined and VELPOT is called again. Optional printing of N_{RUW} , etc. and $\Delta\bar{\phi}$ is done in routine PRINTR.

If sampling of wake washes is desired, subroutine SMPLW is called to compute and print these results.

The $\Delta\bar{\phi}$ array VELPOT and the TVP array are written on scratch file IVPSC for each mode shape.

USAGE: The DWLPT program is the main program of a secondary overlay of the Mach box program. It is called as follows:

CALL OVERLAY (62AFMB0X, 1, 5, 0)

Input: Uses labelled common blocks

| | |
|----------|----------|
| /CONTRL/ | /FILES/ |
| /PROBLM/ | /IOCONT/ |
| /GEOMTY/ | /TAPEIO/ |
| /GEOM2/ | /MODES/ |
| /KERN/ | /ARRAYS/ |
| /KVAL/ | /SAMPLW/ |

Uses scratch files

IGEOSC
IMODESC

Fortran Subroutine POINTR

AUTHOR: G. E. Keylon, G. D. Kramer

PURPOSE: To generate part or all of a pointer array which indexes another array of box associated values (modes, normal-washes, etc.) stored compactly, row-wise.

METHOD: The box codes are scanned to determine the first box of interest and the number of boxes of interest on each row. From this, the pointer array is generated such that IPNTR(1,1) = the location of the first box value for row 1, and IPNTR (2, 1) = the chord number of the first box value for row 1.

USAGE: The routine is called by:

```
DIMENSION IBOX (LBXCD, # chords/10), IPNTR (2, MXIR)
LOGICAL DIAPH, SUBD, WING
```

```
CALL POINTR (IX, MX, MYB, IOVLAP, SUBD, DIAPH, IBOX, LBXCD, MXIR,
             IPOINT, IPNTIN, IPNTR)
```

Input Parameters:

IX = First row of the box pattern for which the pointer array is desired.

MX = Number of rows desired.

MYB = Maximum row length

IOVLAP = Number of rows to allow for overlap (tail only).

SUBD = .T., a pointer array for subdivided boxes is desired
= .F., only unsubdivided box information is desired.

DIAPH = .T., boxes in diaphragm areas are to be included.
= .F., only on-planform boxes are of interest though space may be left within a row if imbedded diaphragm areas occur.

IBOX = Array of subdivided box codes generated in the geometry section.

LBXCD = Length of box code array.

MXIR = Length of IPNTR array, used to control end-around buildup of the array.

IPOINT = Value to be used for first pointer; 1 if IX=1, else the next location available in the array "pointed to" for row IX.

In/out Parameters:

IPNTIN = Location of next available cell in the IPNTR array. This will be incremented for each row processed until MXIR is reached, when it is reset to 1.

IPNTR (2, MXIR) = The pointer array, see Method above.

FORTRAN Subroutine GETAIC

Author: G. D. Kramer

Purpose: To get the desired Aerodynamic Influence Coefficient (AIC) arrays from scratch file IAICSC.

Method: From the calling sequence, the location of the desired AIC array(s) is determined. If they are in core, the routine returns. If there are none, the error flag is set. Otherwise, the disk file is positioned, and the desired arrays are read into local common block AICS.

Usage: EL, YBAR, NROWS, MUAIC (2,50) are in a common block, MUAICS for output from GETAIC
 NWWAIC, NTTAIC, NRWTAIC, NLWTAIC and PAIC (4,50) are in a common block /PAICS/, for use by the routine.
 CALL GETAIC (JUCENT, ITYPE, ICODE, IR)

Input Parameters:

JUCENT = receiving chord number
 IYPE = 1, 2, 3, 4 indicating wing-wing, tail-tail, right-wing-tail, or left-wing-tail AIC's desired
 ICODE = 0, C,V,W desired
 1, V,W desired
 2, V desired

Common Input:

$$\left. \begin{array}{l} \text{NWWK} \\ \text{NTTK} \\ \text{NRWTK} \\ \text{NLWTK} \end{array} \right\} = \text{Number of AIC arrays available for influence.}$$

$$\left\{ \begin{array}{l} \text{wing-wing} \\ \text{tail-tail} \\ \text{right wing-tail} \\ \text{left wing-tail} \end{array} \right.$$

PAIC (4,50) = Table of contents for the AIC's.
 PAIC (I,J) indicates where the AIC's for the Ith form of influence (see above) on the Jth chord are located.

Output Parameters:

IR = D, Success
 1, C not found
 2, C and W not found
 3, Nothing found

Common Output:

$$C = C_{\frac{v\mu\omega}{v\mu\omega}}$$

$$W = W_{\frac{v\mu\omega}{v\mu\omega}}$$

$$V = V_{\frac{v\mu\omega}{v\mu\omega}}$$

Fortran Subroutine VELPOT

AUTHOR: G. D. Kramer

PURPOSE: To compute normal wash and velocity potential values for one mode shape.

METHOD: This routine calculates the following equations:

$$\frac{D\bar{f}_j^{n,m}}{Dt} = \left[i k_j f_j^{n,m} + b_j \frac{\partial f_j^{n,m}}{\partial x} \right] \quad (8)$$

(1) For the wing:

$$N_{RUW}^{n,m} = \frac{D\bar{f}_j^{n,m}}{Dt} - \hat{N}_{RUW}^{n,m} \quad , \quad N_{RLW}^{n,m} = -\frac{D\bar{f}_j^{n,m}}{Dt} - \hat{N}_{RLW}^{n,m} \quad (9)$$

where

$$\hat{N}_{RUW}^{n,m} = \sum_{\substack{\text{left wing} \\ + \text{diaphragm}}} \left[\cos 2\psi_w W_{\bar{\mu}\bar{\lambda}}^{(RW)} - \sin 2\psi_w V_{\bar{\mu}\bar{\lambda}}^{(RW)} \right] N_{RUW}^{\mu,\mu} * \text{SYM} \quad (10)$$

and

$$\hat{N}_{RLW}^{n,m} = - \sum_{\substack{\text{left wing} \\ + \text{diaphragm}}} \left[\cos 2\psi_w W_{\bar{\mu}\bar{\lambda}} - \sin 2\psi_w V_{\bar{\mu}\bar{\lambda}} \right] N_{RLW}^{\mu,\mu} * \text{SYM} \quad (11)$$

and $\text{SYM} = \begin{cases} +1.0, & \text{symmetric} \\ -1.0, & \text{antisymmetric} \end{cases}$

(2) For leading edge or tip diaphragm boxes:

$$\begin{aligned} (N_{RUS} - N_{RLS})^{n,m} = & \frac{1}{C_{\text{geo}}} \left[- \sum_{\substack{\text{right wing} \\ + \text{diaphragm}}} C_{\bar{\mu}\bar{\lambda}0} (N_{RUW}^{\mu,\mu} - N_{RLW}^{\mu,\mu}) \right. \\ & \left. + \text{SYM} * \sum_{\substack{\text{left wing} \\ + \text{diaphragm}}} C_{\bar{\mu}\bar{\lambda}\lambda} (N_{RUW}^{\mu,\mu} - N_{RLW}^{\mu,\mu}) \right] \quad (12) \end{aligned}$$

(3) For wake diaphragm boxes:

$$(N_{RUS} - N_{RLS})^{n,m} = \frac{1}{C_{000}} \left[\Delta \bar{\phi}_j^{n,m} - \sum_{\substack{\text{right wing} \\ + \text{diaphragm}}} C_{j\bar{\mu}\bar{\lambda}} (N_{RUW} - N_{RLW})^{\nu\mu} \right. \\ \left. + \text{SYM} + \sum_{\substack{\text{left wing} \\ + \text{diaphragm}}} C_{j\mu\lambda} (N_{RUW} - N_{RLW})^{\nu\mu} \right] \quad (13)$$

where

$$\Delta \bar{\phi}_j^{n,m} = \Delta \phi_{TE}^m e^{-ik_1 \left(\frac{X_n - X_{TEm}}{b_1} \right)} \quad (14)$$

$$(N_{RUS}^{n,m} + N_{RLS}^{n,m}) = - \left(\hat{N}_{RUS}^{n,m} + \hat{N}_{RLS}^{n,m} \right) \quad (15)$$

(4) For the tail:

$$(N_{RUT} - N_{RLT})^{n,m} = 2 \left(\frac{Df^{n,m}}{Dt} \right) + \left(\hat{N}_{PLT}^{n,m} - \hat{N}_{RUT}^{n,m} \right) \\ - 2 \hat{N}_{RUT}^{n,m} - 2 \hat{N}_{RUT}^{n,m} \quad (16)$$

where $\hat{N}_{RUT}^{n,m}$ and $\hat{N}_{RLT}^{n,m}$ are computed as in Equation (11) and (12).

$$\hat{N}_{RUT}^{n,m} = \sum_{\substack{\text{rt wing} \\ + \\ \text{diaph.}}} \left[\cos(\psi_T - \psi_W) W_{\bar{\nu}\bar{\mu}\bar{\lambda}}^{(RT)} - \sin(\psi_T - \psi_W) V_{\bar{\nu}\bar{\mu}\bar{\lambda}} \right] N_{RW}^{\nu\mu} \quad (17)$$

$$\hat{N}_{RUT}^{n,m} = \text{SYM} \sum_{\substack{\text{left wing} \\ + \\ \text{diaph.}}} \left[\cos(\psi_T + \psi_W) W_{\bar{\nu}\bar{\mu}\bar{\lambda}}^{(LT)} - \sin(\psi_T + \psi_W) V_{\bar{\nu}\bar{\mu}\bar{\lambda}} \right] N_{LW}^{\nu\mu} \quad (18)$$

(5) Velocity potentials:

$$\Delta \bar{\phi}_j^{n,m} = \sum_{\substack{\text{right surface} \\ \text{and diaphragm}}} C_{\bar{\mu}0} (N_{RUS}^{\bar{\mu}} - N_{RLS}^{\bar{\mu}}) + \sum_{\substack{\text{left surface} \\ \text{and diaphragm}}} C_{\bar{\mu}1} (N_{RUS}^{\bar{\mu}} - N_{RLS}^{\bar{\mu}}) * SYM \quad (19)$$

Because the equations involve summations over unknown values, the order of calculation is very critical. The routine computes normal washes and velocity potentials in parallel, one row at a time, inboard-most box first. If the subdivision option is on, each subdivided box must have a set of normal washes computed as well, using equations similar to those above.

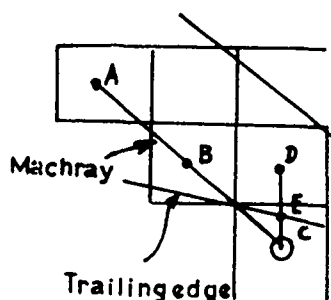

For each box, the \hat{N} terms are first zeroed out. If spatial contribution is present, subroutine GETAIC is called to get the necessary AIC arrays from scratch file IAICSC, and the proper summation is computed over the forward Mach hyperbola. This is first done for \hat{N}_{RUS} and \hat{N}_{RLS} and stored in variables ENRULU, ENRLLL, LUS, LLS

If the surface is a tail, a similar procedure of getting AIC arrays and computing the proper summation for \hat{N}_{RUT} and \hat{N}_{RLT} is followed. The results are stored in ENRURW and ENRULW.

If the box being considered is a planform box, the normal wash values are next computed from Equations (9) or (16).

Function B is called to compute the planar $\Delta \bar{\phi}$ contribution, except for the contribution of the box to itself. This is stored in variable DELPH. If the box is on planform, the out-of-plane contribution is added, yielding Equation (19). If the box is on a diaphragm, DELPH is used in Equation (12) or (13) to eventually yield the normal wash values at the diaphragm box center.

Trailing edge velocity potentials, array TVP, are computed whenever a trailing edge box is encountered. The computation is normally linear extrapolation from the last two box center values. In the event there is only one box on the tip chord, a Mach ray extrapolation is first done, followed by chord-wise linear interpolation. See Figure 11.

Values at A and B are extrapolated to C. Then the values at C and D are interpolated to give a value at E, the desired trailing edge value.

FIGURE 11 Tip Chord Trailing Edge Velocity Potential Calculation

The subdivision option causes the following:

- (1) All row and column loops are on subdivided boxes.
- (2) Any necessary \hat{N} terms are calculated once per control point, and stored in temporary arrays for use on all subdivided boxes within the unsubdivided box. \hat{N} terms and spatial contribution of left surface to $\Delta \bar{\phi}$ are not calculated using subdivided values.
- (3) Function B and $\Delta \bar{\phi}$ are not computed for on-planform subdivided boxes which do not contain a control point.
- (4) Function B, when called, applies two equations - one within the "effective area" of subdivision, and the other outside this area. It is within function B that the subdivision refinement actually takes place.
- (5) Any unsubdivided box which has one or more off-planform subdivided boxes has its normal wash values computed as the average of all subdivided values within its bounds, i.e.

$$N_{RUS}^{n,m} = \left(\sum_{\substack{\text{all subdivided} \\ \text{boxes on box } n,m}} N_{RUS}^s \right) / NSUBDV$$

JSAGE: The subroutine is called by:
 CALL VELPOT(IBOX,LBXCD,PKERNL,SKERNL,WING,DIHS)

Input Parameters:

IBOX Array of box codes for the surface.
 LBXCD Length of the box code array.
 PKERNL Primary (unsubdivided) $C_{\mu 0}$ array.
 SKERNL Subdivided $C_{\mu 0}^{k_1/N_s}$ array.
 WING .TRUE., the surface is a wing.
 .FALSE., the surface is a tail.
 DIHS .TRUE., any surface dihedral is to be accounted for.
 .FALSE., any surface dihedral may be ignored.

Input Common Variables:

Global common blocks used:

/GEOMTY/
 'GEOM2/
 /MODES/
 /FILES/
 /CHECKPR/
 Blank Common for C

Local common values:

| | |
|------------------|--|
| /MUAICS/YBAR | Parallel offset |
| EL | Normal offset |
| MUAIC(2,50) | AIC pointer array determined in the geometry section. |
| NROWS | Number of rows defined for the AIC set. |
| /AICS/ XKVL | Current value of K_1 |
| C | C |
| W | W |
| V | V |
| /DELTAP/{TEXLOC} | {leading } edge X-locations at chord centers |
| {FEXLOC} | {trailing } |
| IPNTRM | Pointer array for modes and velocity potentials. |
| DEFSL | Mode shape array - equivalenced to velocity potential array. |
| IOVLAP | Measure of tail overlap of wing, box mode shapes. |
| /NWASHES/ IPNTDW | Pointer array for normal wash values. |
| /BXCDES/ IBOXW | Wing box codes |

Output Common Variables:

| | | |
|-----------|---------|--|
| /DELTAP/ | DELPHI | $\Delta \bar{\phi}$ array |
| | TVP | $\Delta \bar{\phi}_{TE}$ array |
| /NWASHES/ | ENRUS | N_{RUW} or N_{RUT} |
| | ENRLS | N_{RLW} or N_{RLT} |
| | IOVLAPH | Measure of tail overlap of wing diaphragm, for normal washes. |
| /SNWASH/ | IPNTSD | Pointer array for subdivided normal washes |
| | ENSUBD | $N_{RUS}^{(S)}$ and $N_{RLS}^{(S)}$ |
| | IPNTIN | { End-around pointers for array IPNTSD } |
| | IPNTOT | |
| | IPNTLS | |

Fortran Function B

AUTHOR: G. D. Kramer

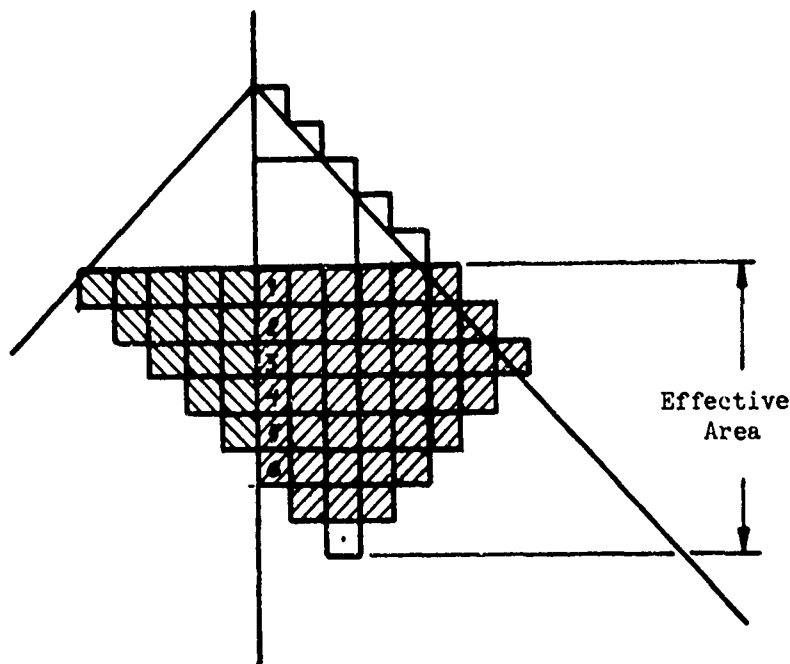

PURPOSE: Given the location of a Mach box, to compute the planar contribution of the rest of the surface to the velocity potential difference for the box.

METHOD: The routine has two sections, one for computing the subdivided contribution within the "effective area," and the other to compute the unsubdivided contribution from ahead of the "effective area". If the subdivision option is off, the second section is used for the full contribution.

In the first section, the summation performed is

$$B_s = \sum_{\bar{v}} \sum_{\bar{\mu}} C_{\bar{v}\bar{\mu}0}^{k_1/N_s} (N_{RUS}^{(s)} - N_{RLS}^{(s)}) \quad (21)$$

where the summation limits are as shown in Figure 12.

 Always contributes to the summation
 Contributes if the dihedral angle $\gamma = 0$

FIGURE 12 Subdivided "Effective Area"

The second section starts up where the first leaves off, and computes the second summation in Equation (22)

$$B = B_s + \sum \sum C_{\bar{v}/\bar{\mu}_0} (N_{RUS} - N_{RLS}) \quad (22)$$

where the summation limits are as shown in Figure 13 and the AIC array and normal wash values are now unsubdivided, computed at control points.

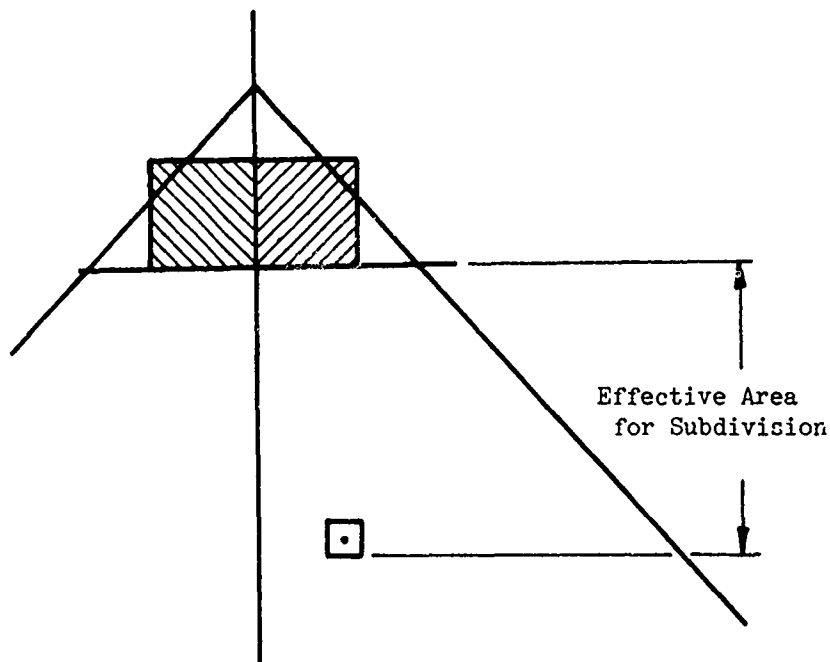

FIGURE 13. Unsubdivided Boxes Outside the "Effective Area"

USAGE:

The function is called by:

DELPH = B(IROW,JCOL,PKERNL,SKERNL,IBOX,LBXCD,WING,DIH)

Input Parameters:

| | |
|--------------|---|
| IROW JCOL | } Location of receiving point, subdivided |
| PKERNL | Primary (unsubdivided) $C_{\bar{v}\bar{\mu}0}$ array |
| SKERNL | Subdivided $C_{\bar{v}\bar{\mu}0}^{k_i/N_i}$ array |
| IBOX | Box code array |
| LBXCD | Length of box/code array |
| WING | .TRUE., the surface is the wing .FALSE., the surface is the tail |
| DIH | .TRUE., leftside is to be ignored .FALSE., Include left side. |

Input Common Parameters:

See subroutine VELPOT. Both subdivided and unsubdivided values are used.

Output:

The function value, B, in this case stored in DELPH, is the result of the summations described under METHOD.

Fortran Subroutine SMPLW

AUTHOR: G. D. Kramer

PURPOSE: To compute and print upwashes, sidewashes, and longitudinal washes at arbitrary chord locations in the wake of a wing.

METHOD: This routine is called once for each sampling chord. For each box on the chord, the right wing contribution is summed as

$$WSUM = \sum_{rt. wing} W_{\bar{\rho} \bar{\mu} \bar{\lambda}} * N_{RW}^{\nu \mu} \quad (23)$$

$$VSUM = \sum_{rt. wing} V_{\bar{\rho} \bar{\mu} \bar{\lambda}} * N_{RW}^{\nu \mu} \quad (24)$$

$$PHISUM = \sum_{rt. wing} C_{\bar{\rho} \bar{\mu} \bar{\lambda}} * N_{RW}^{\nu \mu} \quad (25)$$

where $N_{RW} = \begin{cases} N_{RUW} & \text{if the chord is above the wing,} \\ N_{RLW} & \text{if the chord is below the wing.} \end{cases}$

These sums are then combined as:

$$UW_R = \frac{u}{U} = \left(1/b_1\right) * \left(\cos \psi_w * WSUM + \sin \psi_w * VSUM\right) \quad (26)$$

$$SW_R = \frac{v}{U} = \left(1/b_1\right) * \left(\cos \psi_w * VSUM - \sin \psi_w * WSUM\right) \quad (27)$$

$$PHI_R = PHISUM$$

The left wing contributing summations are identical to Equations (23), (24), and (25), with N_{RW} replaced by N_{LW} .

The results are then combined by

$$UW_{complete} = UW_R + \left(1/b_1\right) * \left(\cos \psi_w * WSUM - \sin \psi_w * VSUM\right) * SYM \quad (28)$$

$$SW_{complete} = SW_R + \left(1/b_1\right) * \left(\cos \psi_w * VSUM - \sin \psi_w * WSUM\right) * SYM \quad (29)$$

$$\text{PHI}_{\text{complete}} = \text{PHI}_R + \text{PHISUM} * \text{SYM} \quad (30)$$

The printed upwash and sidewash is given by Equations (28) and (29). For longitudinal wash, the PHI values computed in Equation (30) are used in

$$\text{LW}(I) = \frac{1}{2b_1/\beta} \left[\text{PHI}(I+1) - \text{PHI}(I-1) \right] \quad (31)$$

USAGE: The routine is called by:
 CALL SMPLW(IBOX,LBXCD,JCHRD,JT,IFRST,ILAST)

Input Parameters:

| | |
|-------|--|
| IBOX | Array of wing box codes |
| LBXCD | Length of box code array |
| JCHRD | Sample wash chord number, with reference to the order specified in the card data |
| JT | The y-location of the chord |
| IFRST | Number of the first sample box desired |
| ILAST | Number of the last sample box desired |

9. VELOCITY POTENTIAL SMOOTHING SECTIONS

FORTRAN Program SMTH

Author: G. E. Keylon

Purpose: To smooth the velocity potentials by using a least squares surface fitting technique.

Method: The velocity potentials are read in from a disk file and smoothed with a least squares fit by subroutine FITTER, previously described. The polynomial equation derived from the fit is then used to compute an array of velocity potentials at planform box centers.

Usage: The SMTH program is the main program of a secondary overlay of the Mach box program. It is called as follows:

```
CALL OVERLAY (6HAFMBØX, 1, 6, 0)
```

Input:

USES LABELLED COMMON BLOCKS

```
/ARRAYS/  
/FILES/  
/IOCONT/  
/PROBLM/  
/KVAL/  
/GEOMTY/  
/GEOM2/  
/TAPEIO/  
/RWBUFF/
```

Uses the following files
MODESC, IGEOSC, IVPSC

Output:

Output is stored on file IUTFSC which is changed to IVPSC.

FORTTRAN Program CRDFIT

Author: G. E. Keylon

Purpose: To smooth the velocity potentials by using a least squares curve fit along each chord.

Method: The velocity potentials are read in from a disk file. The values for each chord are then separated into an array. The values are then changed to the numerical slope between the midpoint average values. Subroutine CURVE is then called to fit a least squares polynomial curve through these slopes. The polynomial equation is then integrated at each box on the chord and the integral value becomes the velocity potential at that box.

Usage: The CRDFIT program is the main program of a secondary overlay of the Mach box program. It is called as follows:

CALL OVERLAY (6HAFMBOX, 1, 7, 0)

Input:

USES LABELED COMMON BLOCKS

/ARRAYS/
/FILES /
/IOCONT/
/PROBLM/
/KVAL /
/GEOMTY/
/GEOM2 /
/TAPEIO/
/RWBUFF/

Uses the following files

MODESC, IGEOSC, IVPSC

Output:

Output is stored on file IWTFSC which is changed to IVPSC.

FORTTRAN Subprogram CURVE

Author: G. E. Keylon

Purpose: To fit a curve in the least squares sense through a set of data points.

Method: The CURVE routine is passed a set of ordered complex pairs and the degree of polynomial to fit. The system of simultaneous linear equations is solved employing the Choleski square root method (see Ref. 1). If the polynomial degree exceeds the limits possible to fit the degree is reduced to a lower level.

Usage: CALL CURVE (M,N,X,Z,C)

Input:

- M - degree of polynomial equation
- N - number of data points to fit curve through
- X - Array of X coordinates (independent variable)
- Z - Array of Z coordinates (dependent variable, complex)

Output:

- C - output polynomial coefficient array, complex

10. GENERALIZED AIR FORCES SECTION

Fortran Program FORCES

AUTHOR: G. E. Keylon, G. D. Kramer

PURPOSE: To calculate the boxlifts, section lifts, and generalized air forces for a problem.

METHOD: Planform information is first read from the geometry and modes scratch files. The outer-most loop on thickness slope functions is then entered. One set of thickness slope functions, defined at box centers by Equation (1), is read in from scratch file ITSLSC. Next a loop on mode shapes, used as weighting functions for the generalized forces calculations, is entered. One mode shape is read from scratch file MODESC.

The third loop entered is on velocity potentials. The $\Delta\phi$ array is read into DELPHI and $\Delta\phi_{TE}$ into array TVP from scratch file IVPSC. The box pattern for each surface is then passed over, one row at a time. For each box the following values are computed:

$$\bar{L}_j^{nm} = \text{BXLIFT}(IDC) = \frac{2}{\beta} \left[\Delta\bar{\phi}_{jTE}^{nm} - \Delta\bar{\phi}_{jLE}^{nm} + i\alpha^{nm} k_1 \Delta\bar{\phi}_j^{nm} \right] \bar{Z}_\tau^{nm} \quad (3.1)$$

$$\Delta C_{Pj}^{nm} = \text{DELCP}(IDC) = \bar{L}_j^{nm} / (\alpha^{nm} * b_1) \quad (3.2)$$

$$\bar{Q}_{ij}^{nm} \beta_{1/2} = \left[\left(f_{TE}^{nm} * \Delta\bar{\phi}_{TE}^{nm} - f_{LE}^{nm} * \Delta\bar{\phi}_{LE}^{nm} \right) - b_1 \alpha^{nm} \frac{\partial f}{\partial x} \Delta\bar{\phi}_j^{nm} + i\alpha^{nm} k_1 f^{nm} \Delta\bar{\phi}_j^{nm} \right] \bar{Z}_\tau^{nm} \quad (3.4)$$

The $\bar{Q}_{ij}^{nm} \beta_{1/2}$ terms are summed as calculated, and stored as

$$\text{AFROW}(JVP) = \sum_m \sum_n Q_{ij}^{nm} \beta_{1/2} \quad (3.5)$$

After all boxes have been processed, if boxlifts and section lifts are desired and this is the first mode shape, box lifts are printed, section lifts are computed and printed, and total lift is printed:

$$\bar{L}_j^m = \text{SLIFT}(UCOL) = \sum_n \bar{L}_j^{nm} \quad (3.6)$$

$$\bar{L}_j = \text{TLIFT} = \sum_m \bar{L}_j^m \quad (3.7)$$

After this has been done for all velocity potentials, one row of the final generalized air forces arrays is computed as:

$$\bar{Q}_{ij} = \text{GENAF}(IJ) = 2/\beta \text{ AFROW}(JVP) \quad (38)$$

$$Q'_{ij} = -b_1/s^3/\beta \text{ Re} [\bar{Q}_{ij}] \quad (39)$$

$$Q''_{ij} = -b_1^2/(k_1 s^4/\beta) \text{ Im} [\bar{Q}_{ij}] \quad (40)$$

The program does the above for all mode shapes, prints the results, optionally writes them on tape, then terminates. Printing is done in routines PRNTBL, PRNTSL, and PRNTAF.

For Equations (32) and (34) box leading and trailing edge values are needed. Several geometric conditions exist:

- (1) Box leading or trailing edge is internal to the planform:
Linear interpolation is used,

$$f_{LE}^{nm} = \frac{1}{2} (f^{n-1,m} + f^{n,m}) \quad (41)$$

$$\Delta \bar{\phi}_{LE}^{nm} = \frac{1}{2} (\Delta \bar{\phi}^{n-1,m} + \Delta \bar{\phi}^{n,m}) \quad (42)$$

and similarly for the box trailing edge.

- (2) Box is cut by the planform leading edge:

$$f_{LE}^{nm} = f^{nm} - (X_n - X_{LE}) * \frac{\partial f^{nm}}{\partial x} \quad (\text{point-slope}) \quad (43)$$

$$\Delta \phi_{LE}^{nm} = \begin{cases} 0 & \text{for wing or spatial tail} \\ \Delta \bar{\phi}_{TE \text{ of wing}} * e^{-i \frac{(X_{LE}^m - X_{TE}^m)}{b_1}} k_1 & \end{cases} \quad (44)$$

(3) Box is cut by the planform trailing edge

$$f_{TE}^{nm} = f^{nm} + (X_{TE} - X_n) \cdot \frac{\partial f^{nm}}{\partial x} \quad (45)$$

$\Delta \bar{\phi}_{TE}$ Computed planform trailing edge value, TVP, as described under subroutine VELPOT. This normally is a linear extrapolation using the forward adjacent box center and the current one for the two necessary $\Delta \bar{\phi}$ values.

USAGE: The FORCES program is the main program of a secondary level overlay of the Mach Box program. It is called as follows:

CALL OVERLAY(6HAFMBØX, 1, 7, 0)

Input:

Uses labeled common blocks:

/ARRAYS/
/FILES/
/IOCONT/
/KERN/
/KVAL/
/PROBLM/
/MODES/
/GEOMTY/
/GEOM2/
/TAPEIO/
/RWBUFF/

Uses the following files:

MODESC
IPNTRM
IVPSC
ITSLSC

Output:

Printer and tape NOUTP (optional).

11. COMMON BLOCK ORGANIZATION

The basic geometric and program control parameters are stored in a set of labeled common blocks which are loaded with the primary level overlay and thus are available to any secondary overlay. Some of the variables come directly from card input values (see Part I, Section III of this report), and others are internally computed.

12. ARRAY STORAGE

In order to conserve storage, a number of arrays are used as pointers for sparse arrays. All unusual array usage is described below.

a. Arrays Generated in the Geometry Section

IBOXW - Subdivided box pattern for first planform, or both if "coplanar"

IBOXT - Subdivided box pattern for 2nd planform, if non-"coplanar"

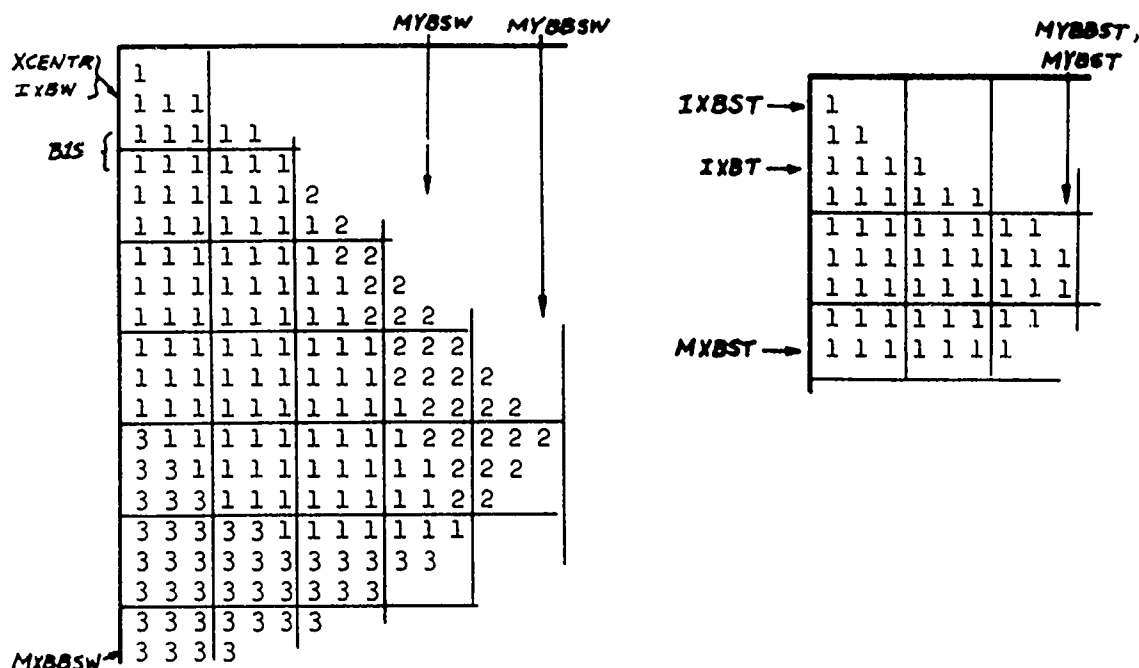

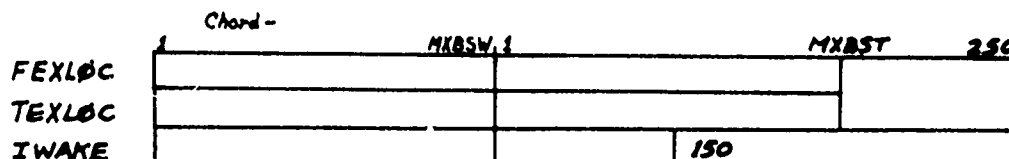

FIGURE 14. Box Code Arrays

The box code arrays are packed twenty numbers to a word, so IBOXW(1,1) contains codes for box (1,1) through box (1,20), IBOXW(2,1) contains codes for box (2,1) through box (2,20), etc.

FEXLOC(I) = The location of the leading edge at chord I, normalized to BLS with 1.0 corresponding to the center of the 1st (subdivided) row.

TEXLOC(I) = Same for trailing edge.

IWAKE(I) = Aftmost subdivided wing wake box needed by the tail.

For each AIC array needed:

| | | | | | | | | | | | | |
|-------|---|--|--|--|--|--|--|--|--|--|--|-------|
| | | | | | | | | | | | | NROWS |
| MUAIC | 1 | | | | | | | | | | | |
| | 2 | | | | | | | | | | | |

MUAIC(1,J) = first box needed in row j
MUAIC(2,J) = last box needed in row j

FIGURE 17. AIC Array Pointers

The four KPT-- arrays indicate the location on scratch file IATSSC of the desired AIC array set. For example, KPTT(3) is the AIC set number (4 matrices per set) of the AIC's for the influence of the left tail on right tail chord 3.

b. Arrays generated in the Modes Section

IPNTRM Pointer array for planform boxes on a row.

| | J = 1 2 3 4 | | | | N N+1 | | | |
|-------------|-------------|---|---|----|-------|----|----|--|
| IPNTRM(1,J) | 1 | 2 | 5 | 10 | | 81 | 89 | |
| IPNTRM(2,J) | 1 | 1 | 1 | 1 | | 3 | 0 | |

J Normally the row number for which the pointer value is being computed. If there are 2 surfaces that are noncoplanar, the value of J representing the first row of the second planform is MYBW+IOVLAP. IOVLAP is the number of rows on the tail planform that have same x coordinates as rows on the wing planform. If there are no rows with this condition IOVLAP is zero.

IPNTRM(1,J) The sequential count + 1 of all boxes, planform or wake region, that are on or between the first and last planform box of all rows forward of the one J represents

IPNTRM(2,J) The chord number of the first planform box on the row represented by J.

FIGURE 18. Row Pointers

c. Arrays Generated in the AIC Section

The $C_{D\mu\lambda}$, $W_{D\mu\lambda}$ and $V_{D\mu\lambda}$ arrays are stored in a one dimensional matrix. For planar AIC's the $W_{D\mu\lambda}$ and $V_{D\mu\lambda}$ are not computed and the $C_{D\mu\lambda}$ array is calculated for 1/2 of the Mach cone since it will be symmetrical. If subdivision is applied then 2 planar arrays are calculated with the subdivided array overlaying part of the un-subdivided array.

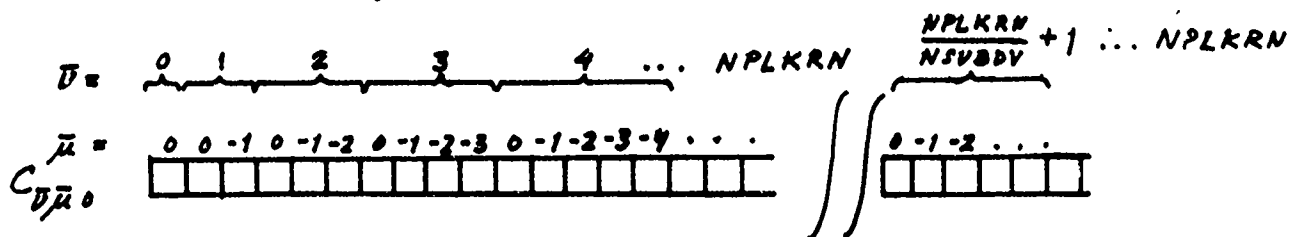

FIGURE 19. Planar AIC

For unsubdivided cases the array ends when $\bar{v} = \text{NPLKRN}$. For subdivided cases when $\bar{v} = \text{NPLKRN}$ the array contains the subdivided AIC calculated at $k_1 = k_1 / \text{NSUBDV}$. \bar{v} then is reduced to $\frac{\text{NPLKRN}}{\text{NSUBDV}} + 1$ and is allowed to increase again until it reaches NPLKRN or the number of rows to cover the planform.

Because of the possible condition where the receiving point of a planform may not be in alignment with boxes on other planforms the spatial AIC's must be calculated on both sides.

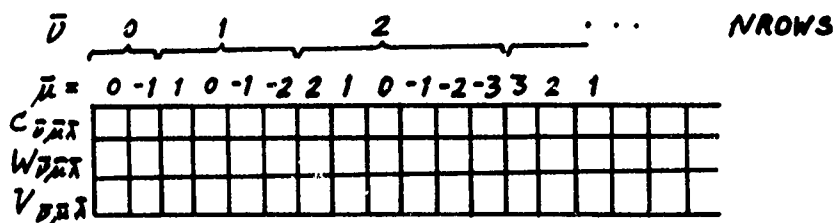

FIGURE 20. Spatial AIC's

13. INTERNAL SCRATCH FILES

a. Matrix Format

All arrays written on disk or tape files are formatted as variable sized matrices. Each matrix consists of two logical records of binary information, the first one being a 16-word matrix identification record, and the second containing the contents of the matrix. The reading/writing of these matrices is done by subroutines READMX and WRTEMX. In the following tape maps, each matrix is a separate box.

Matrix Identification Record - 16₁₀ words

| Word | Contents |
|------|--|
| 1 | One-word ID label, an integer or label |
| 2 | M, the number of rows in the matrix |
| 3 | N, the number of columns in the matrix |
| 4 | Not used, = 0 |
| 5 | Not used, = 0 |
| 6 | Number of words in matrix record |
| 7 | K_1 |
| 8 | Mach Number |
| 9 | } User parameters, array PARM |
| 10 | |
| 11 | |
| to | |
| 16 | |

Matrix Record - variable length (word 6 above)

Ordered consecutively by row, left to right within each row.

b. Geometry Scratch File IGEO SC

This file is generated in the geometry processor and contains all large geometry arrays. The space after the two geometry files is used for temporary scratch during mode shape processing.

| | | Matrix Dimensions | Parameter Array |
|---|--------|---|--|

d. Thickness Slopes Scratch File ITSLSC

This file is equivalenced to IWTFSC, which is first used in GEOMBX for temporary scratch while building the MUAIC arrays. The thickness slope functions are then written on the file at the end of the modal data processor. If $NTSLOP = 0$, one matrix of ones will be written, corresponding to $\frac{\partial z}{\partial x} = 0$.

N = IPNTRM(1,NPNTRS)-1

e. Spatial AIC Scratch File IAICSC

This file is first used for internal scratch during calculation of polynomial coefficients by the modal data processor. In the AIC section it is written with all spatial AIC's needed for one reduced frequency, as determined in the geometry section. IAICSC is re-written for each new reduced frequency.

| | Matrix Dimensions | Parameters |

| EOF | | |

f. Velocity Potentials Scratch File IVPSC

This file is first used for internal scratch by the geometry processor while assembling MUAIC arrays. It is later used in the modal data processor as temporary storage for the wing mode shapes to be merged with the tail modes, and again for the same purpose when working with thickness slope functions. In the normal wash and velocity potentials section it is written with the $\Delta\phi$ and ΔA_{12} arrays for each mode.

14. OUTPUT FILES

The program generates three optional output files. Two of them, the AIC files, are designed for reuse with the program during subsequent executions. The program automatically searches these files and updates them with any new AIC's generated.

The optional final output file is designed to pass the generalized air-forces matrices on for flutter or dynamic loads analyses. It is written optionally in the forces section of the program.

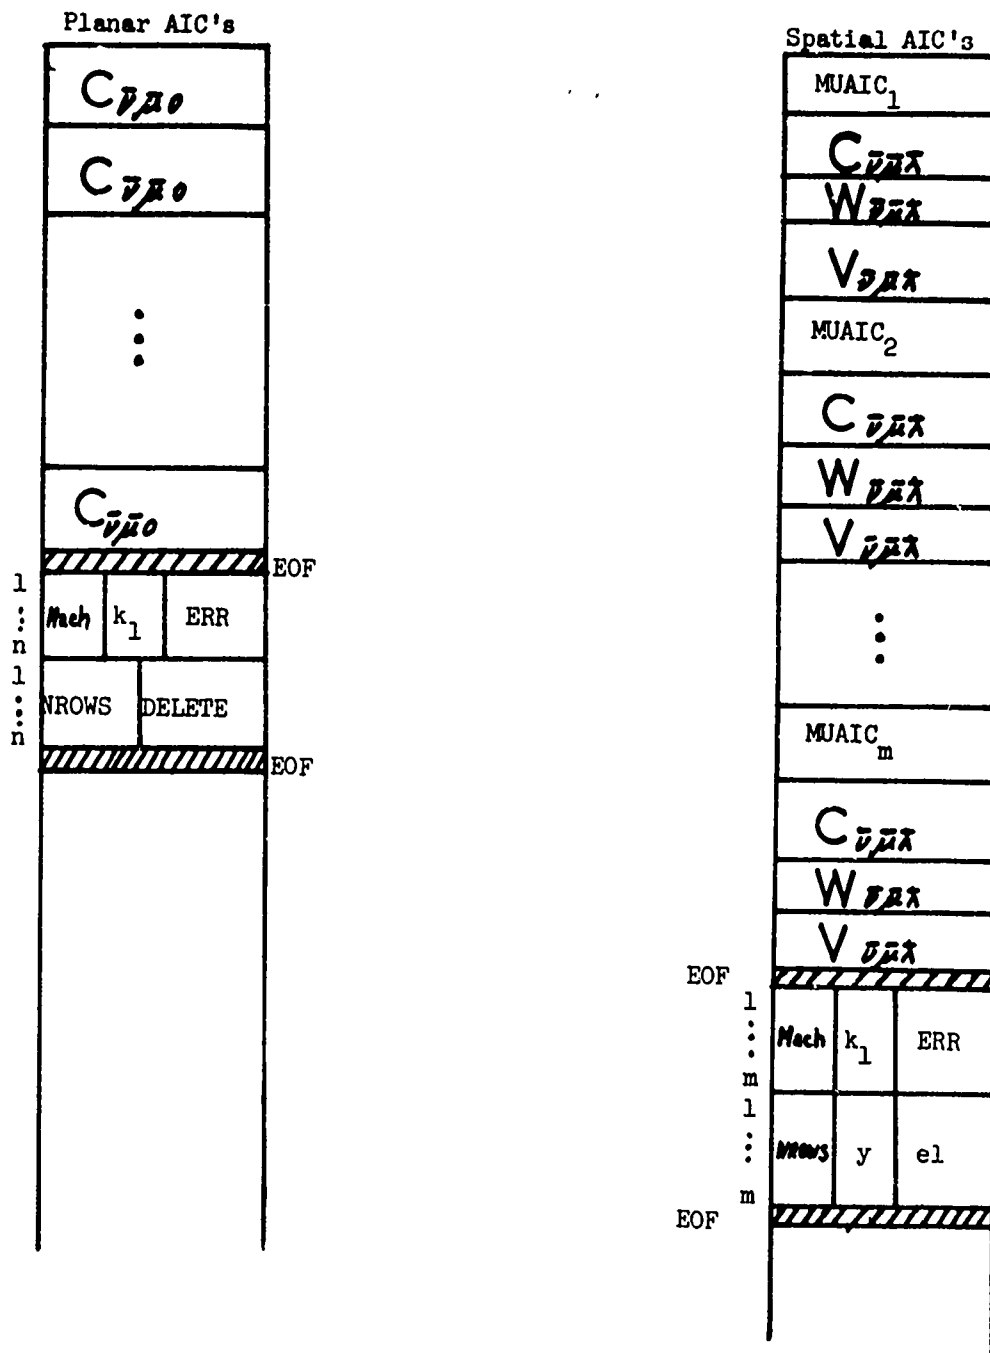

FIGURE 11. Tape Storage of AIC Arrays

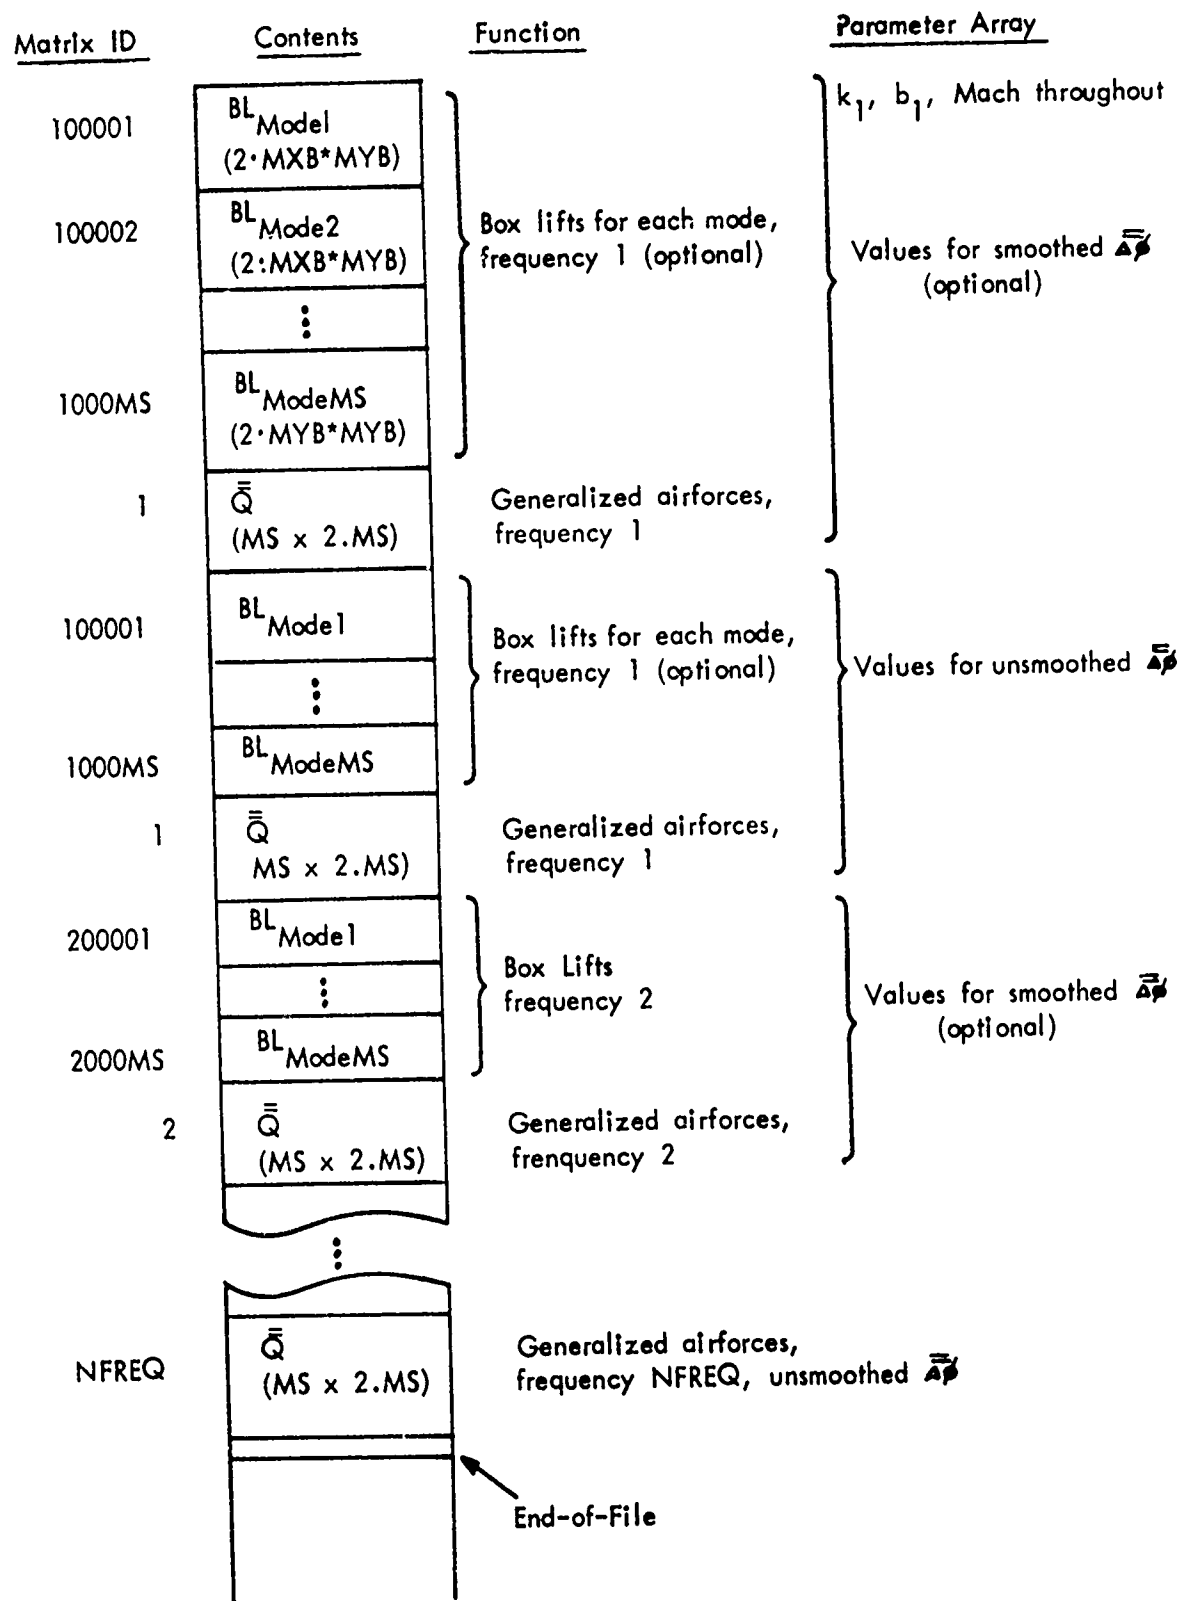

FIGURE 22. TAPE MAP OF FORCES OUTPUT TAPE

15. IMPLEMENTATION AND DEBUGGING

a. Update

The source program is written and maintained using the CDC 6600 SCOPE operating system UPDATE feature. Under UPDATE, all coding is either part of a *COMDECK or a *DECK. A *COMDECK may be replicated many times throughout the other decks. This feature is used for all global labeled common blocks and for most local common blocks, to insure that all routines needing them have identical common statements. A few subroutines which are needed in more than one overlay are also set up as *COMDECKs. The names of the *COMDECKs and *DECKs correspond as closely as possible to their Fortran identifiers - program name, subroutine name or common block name.

b. Open-ended Features

The writers of the program feel that most potential users probably have unique system features which may be utilized to optimize the execution of the program beyond its release status. With this in mind, numerous "hooks" have been coded in to make other features easy to implement.

1. All references to disk or tape files are by name, rather than by number. All file names are together in one common block, /FILES/. The internal scratch files are defined in one DATA statement in the zero overlay DRIVER, and the input, output and AIC files are defined via card input data.
2. All reading and writing of internal and external scratch files is handled by subroutines READMX and WRTEMX. These routines have several calling parameters which are unused, but available if it is desired to make use of labeling, random I.O., or level numbers. Because READMX and WRTEMX use BUFFERIN and BUFFEROUT, all files may share a common buffer area, allowing for a considerable savings in storage requirements.
3. Subroutine FLUSH is always called when a fatal error is encountered. This routine may be written to make use of any system error recovery procedure available. The release version prints a comment, flushes the OUTPUT file, and terminates with a Mode 1 error.
4. Subroutine DTIME is called between each secondary overlay. The release version returns CP time only; however, provision is made for PP time if the implementing system has that capability.

c. Debugging

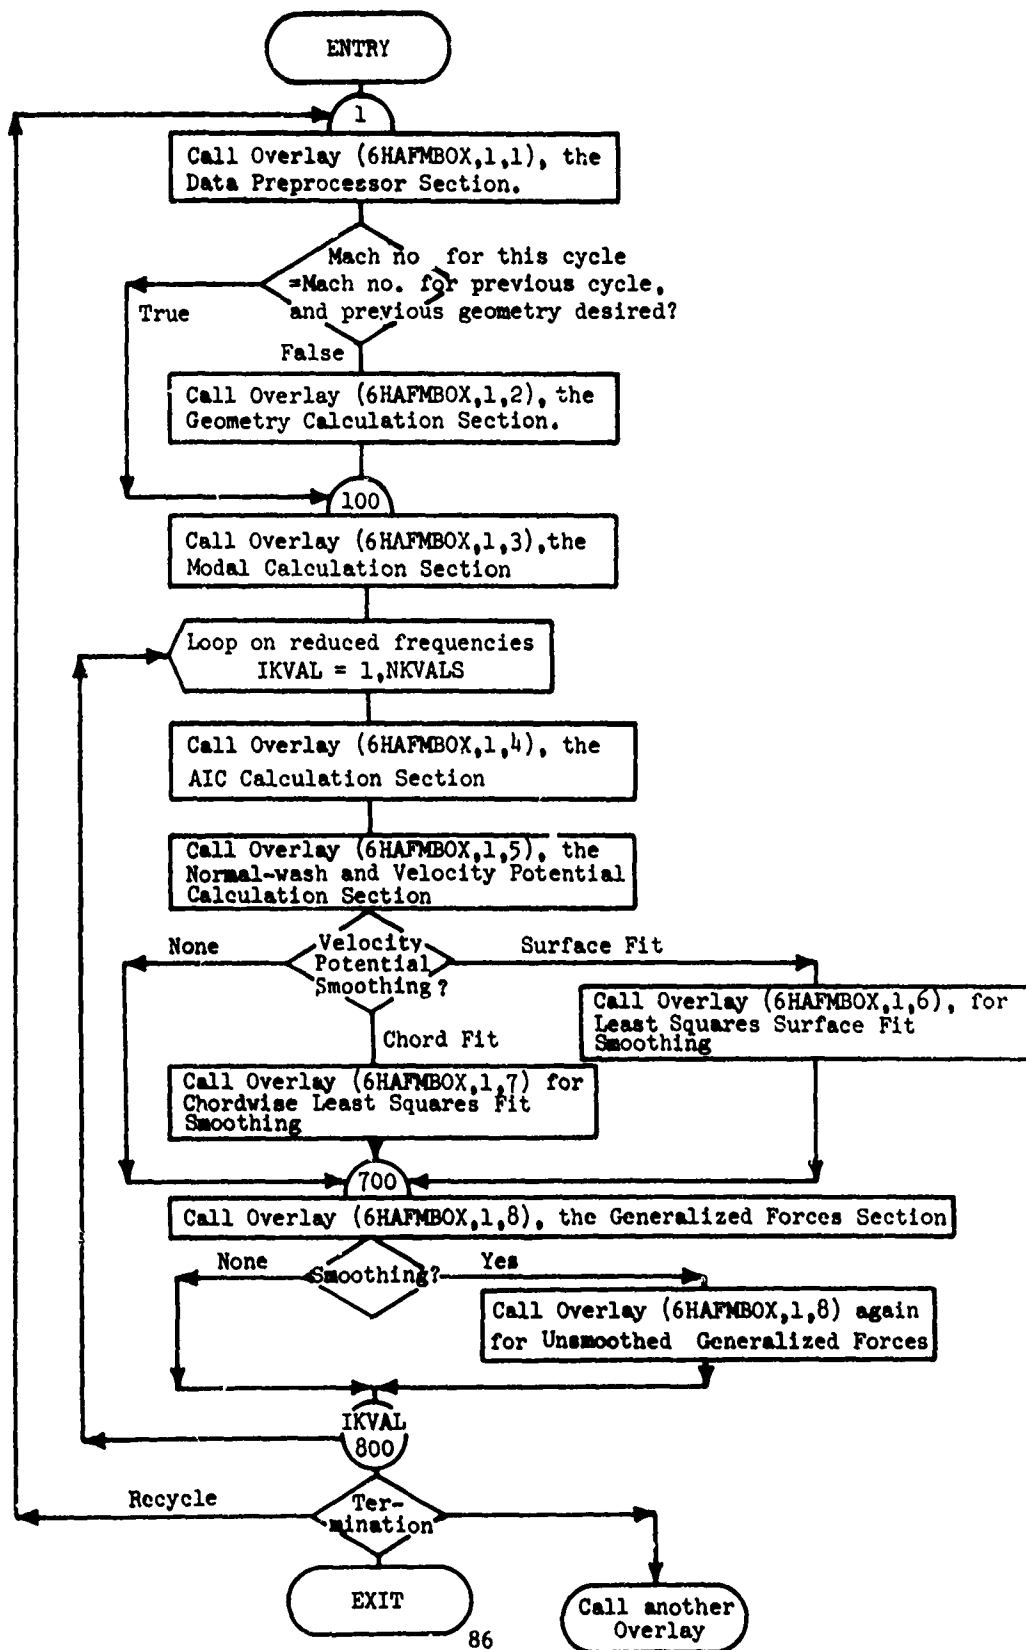

It is recommended that a new user first run one of the sample data cases, to familiarize himself with the program features and to insure

that the program gives correct answers at his installation.

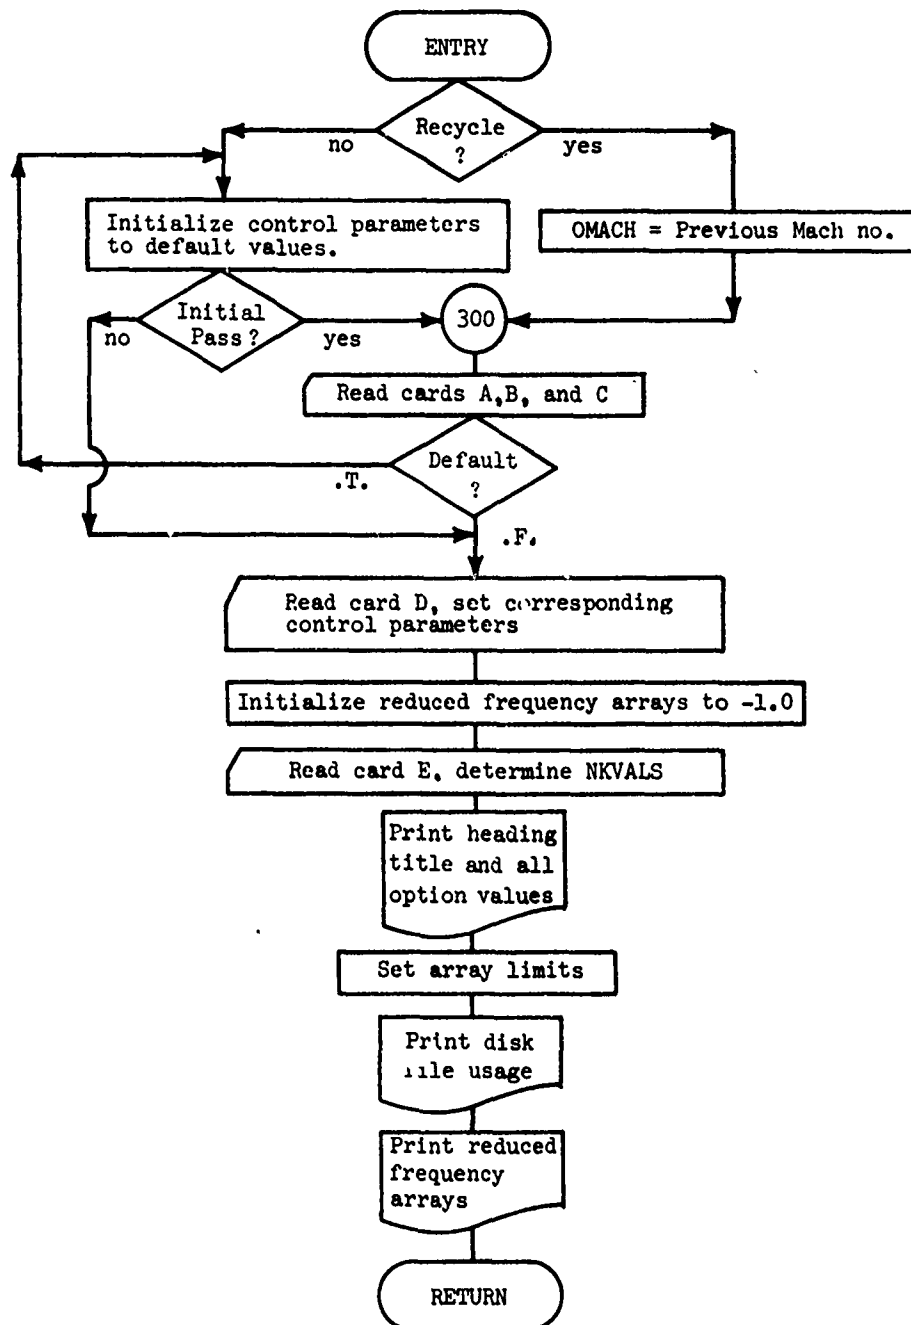

In the event the program fails "hard" (mode error, time limit, etc.), standard use of listings, load maps and dumps will usually pinpoint the cause.

If the program executes but seems to give bad numbers, additional intermediate printout may be helpful. The variables in common block /CHECKPR/ are designed to control the printing of additional check values. Each variable controls printing from one secondary overlay, so only the suspected area need be printed. The check prints provided are rudimentary, so for given problems additional prints would probably have to be written, but if they are made conditional on the common variables, they can be left in for future needs. The CHECKPR variables are all read from Card C of the data, or may be set in an executable statement after the call to DATAPP.

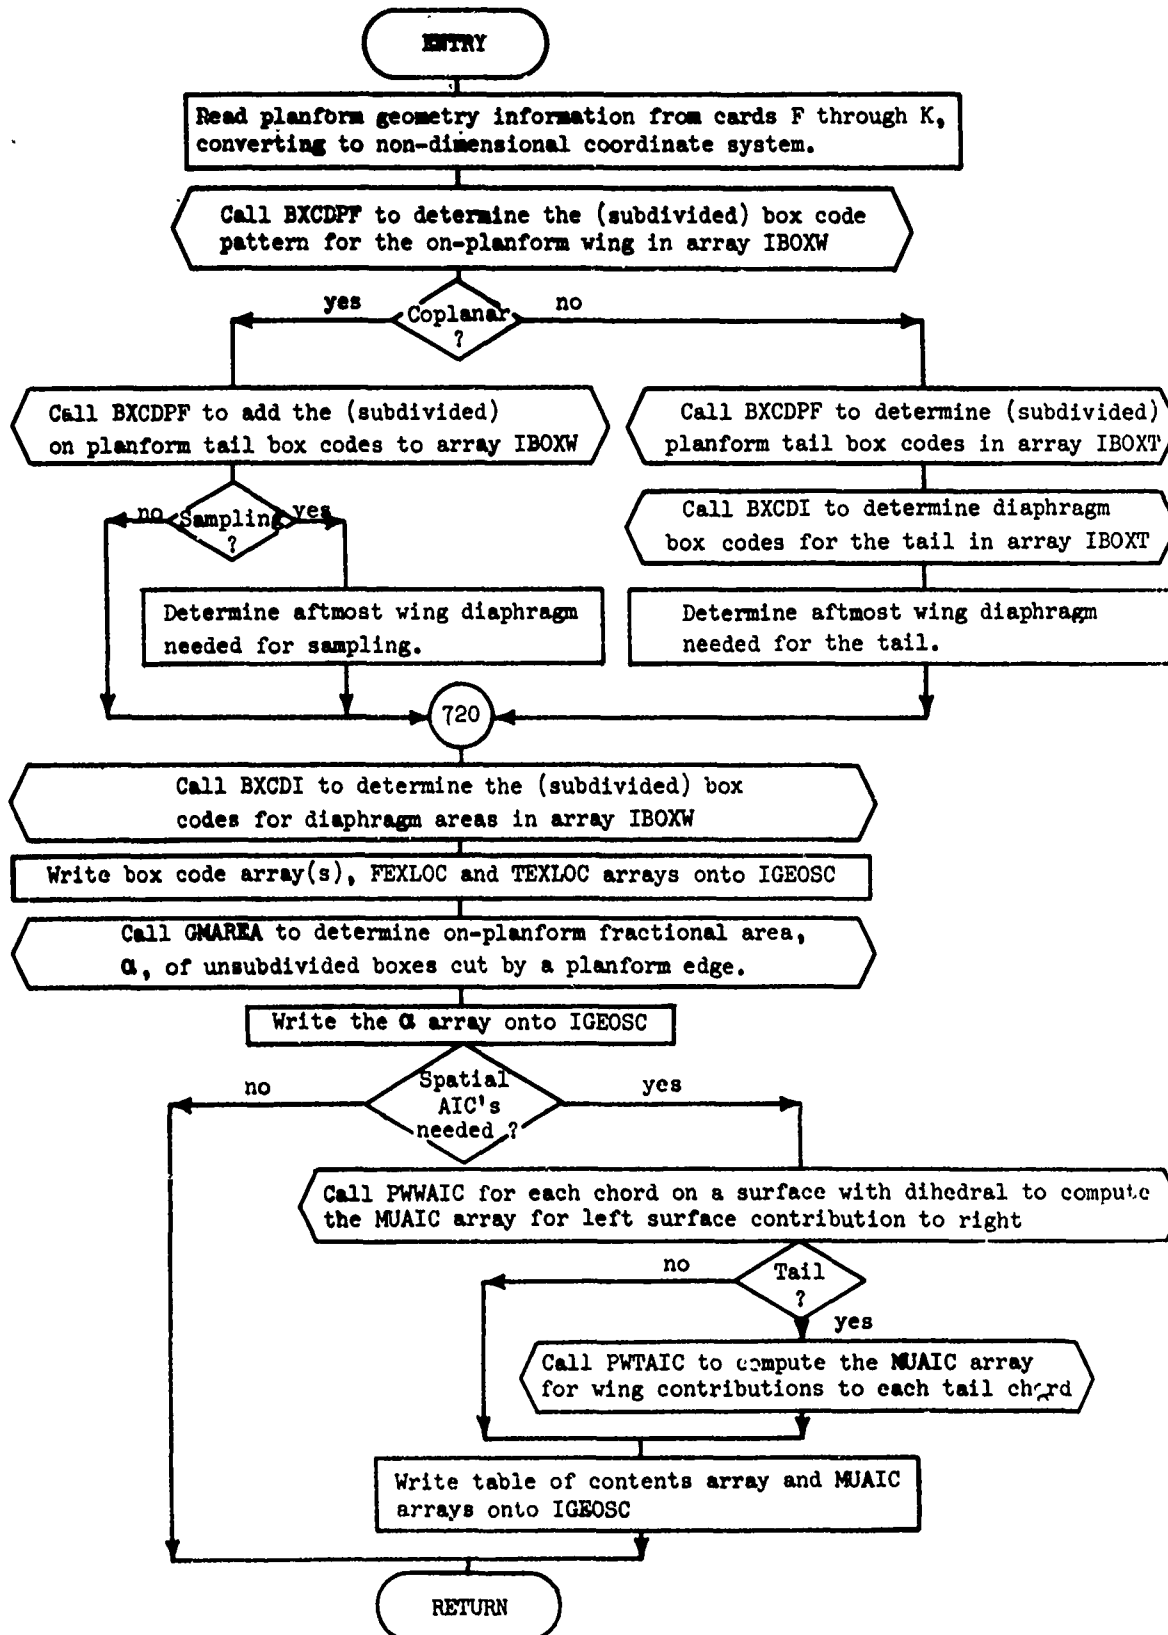

Program CONTROL — Primary level overlay which controls the program flow

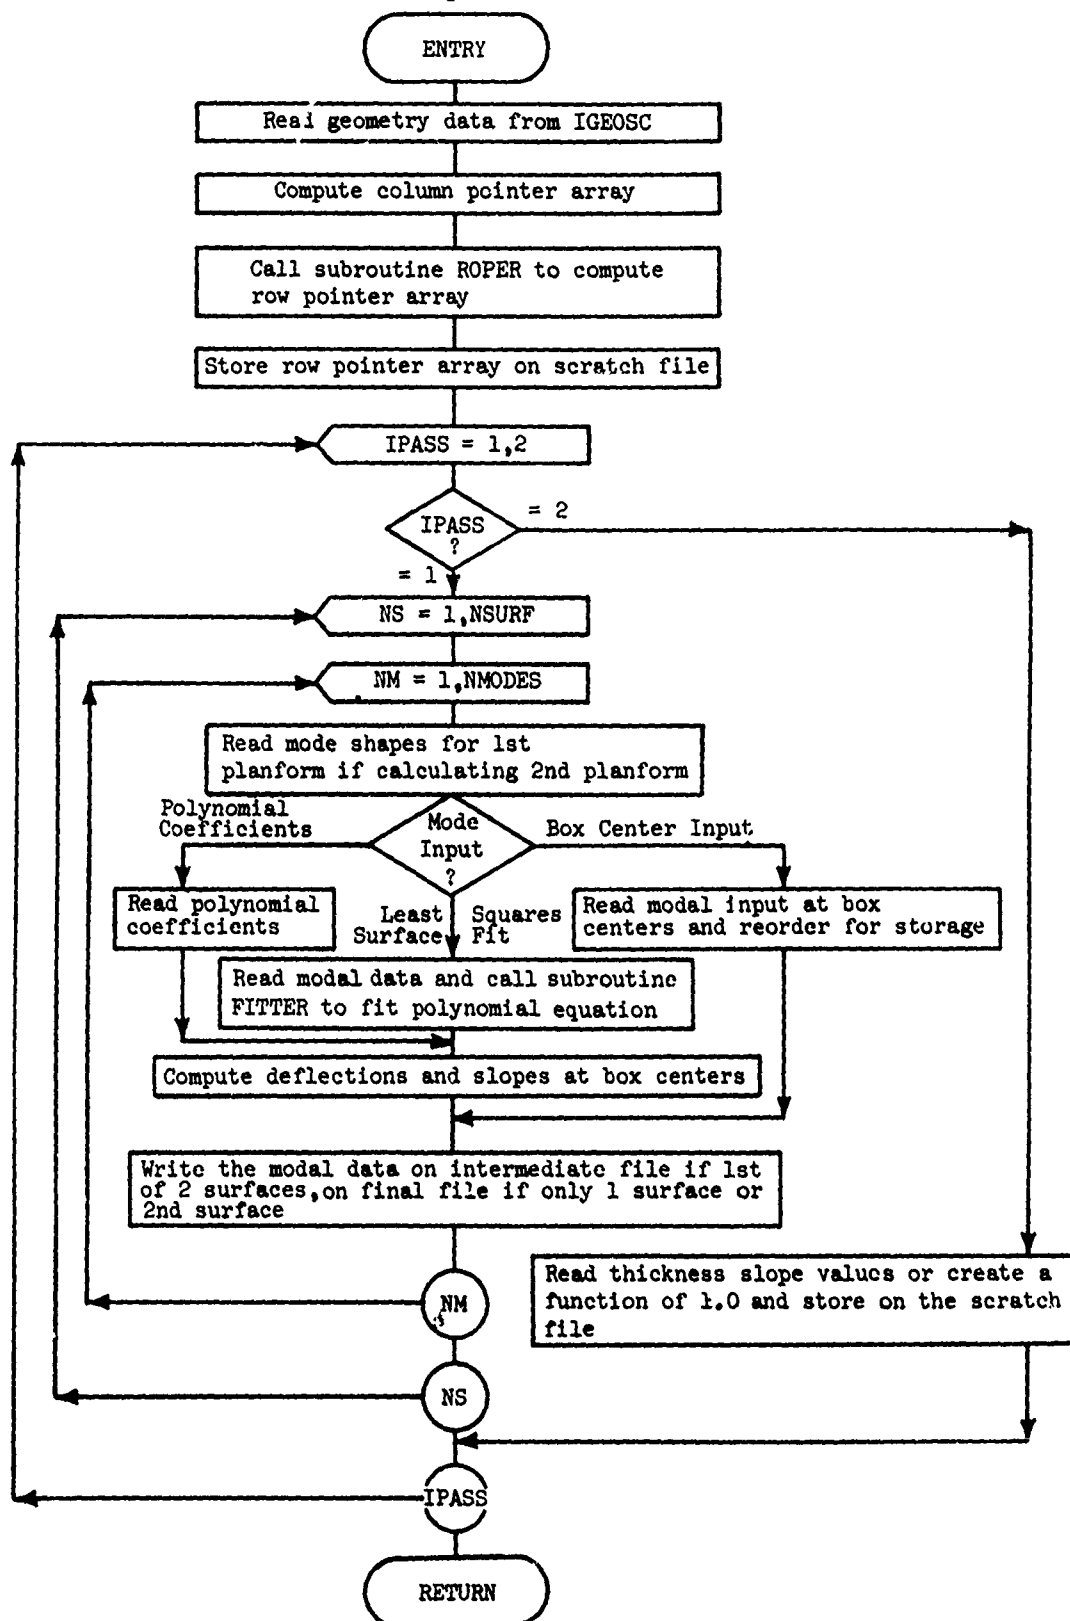

Program DATAPP — Secondary overlay which initiates control parameters as a function of defaults or card data.

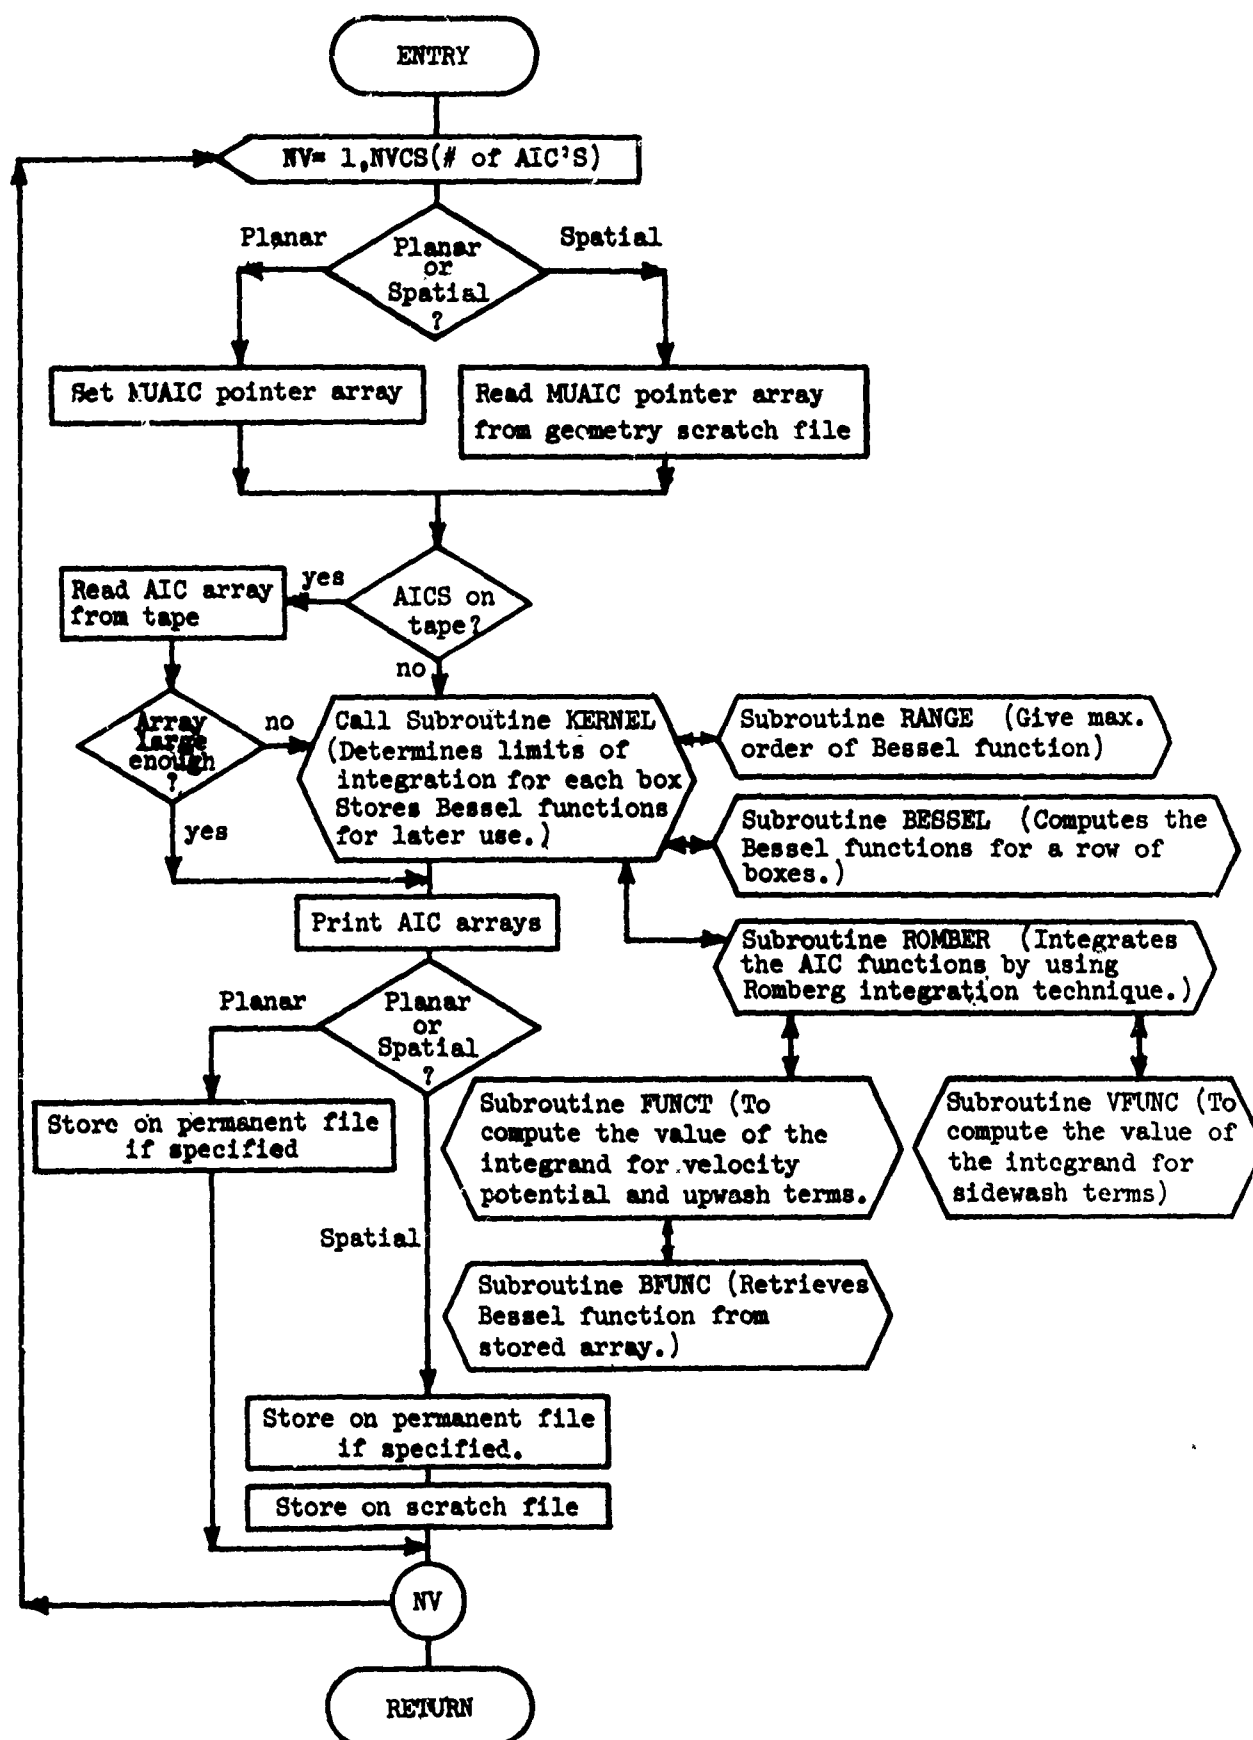

Program GEOSK — Secondary level overlay which computes planform geometry.

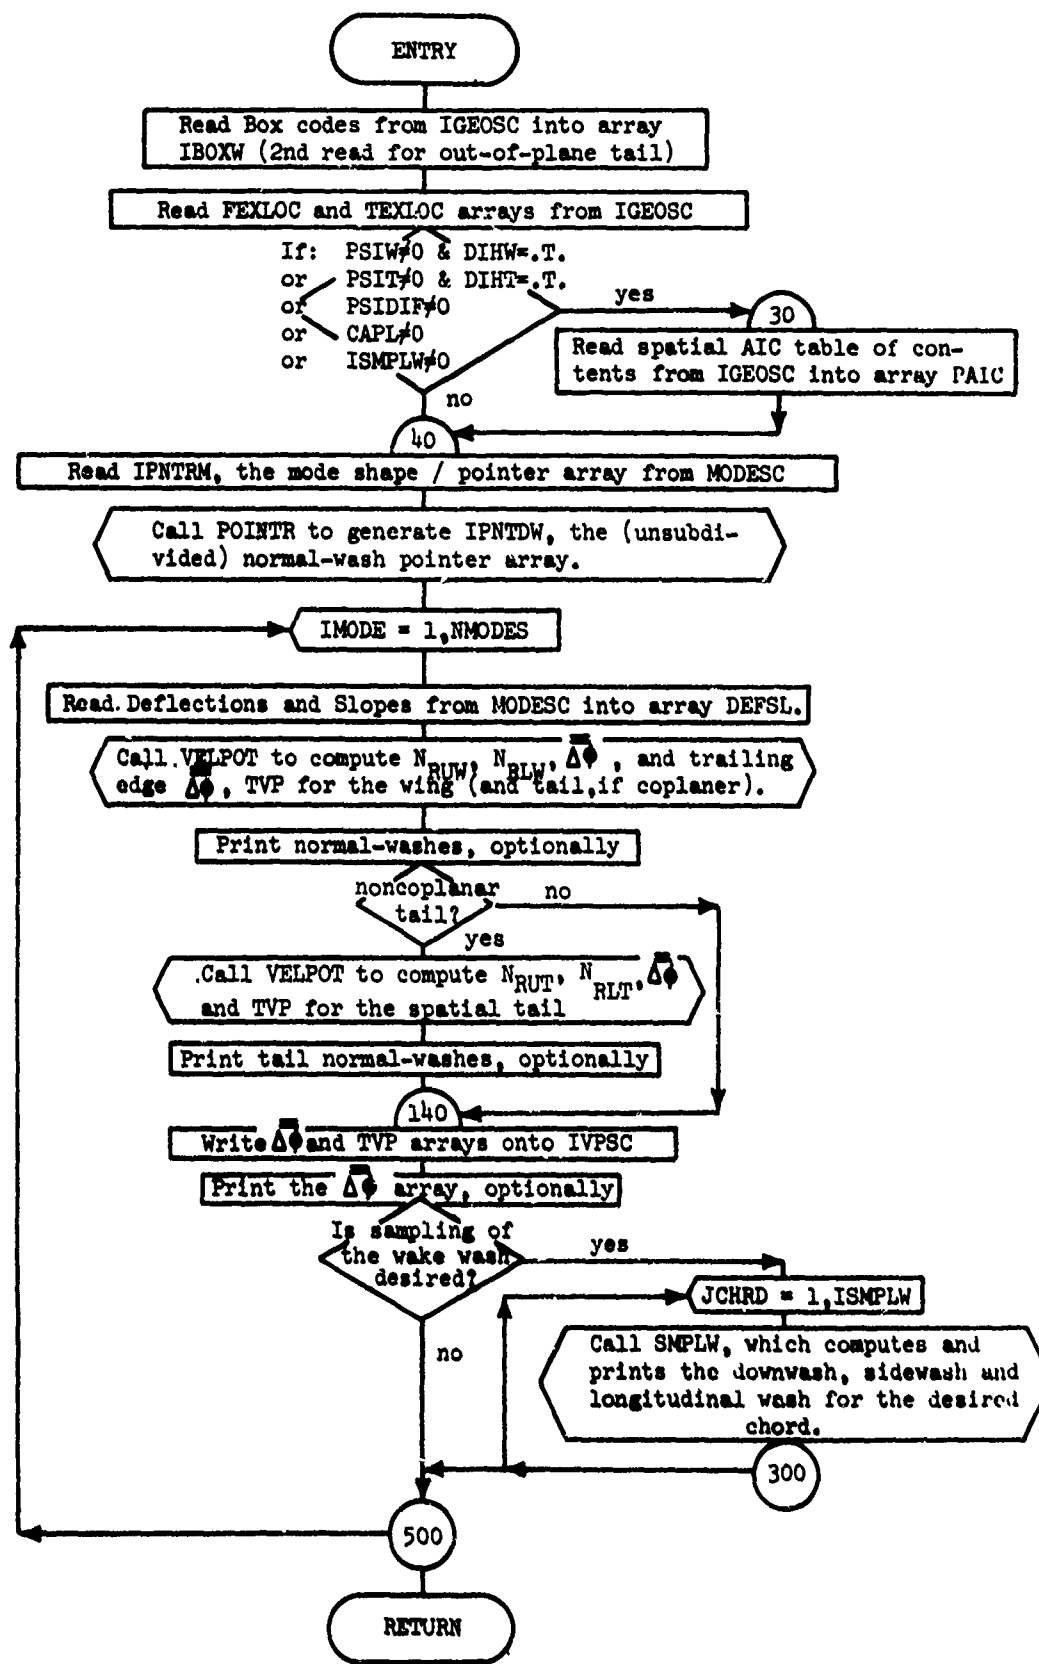

Program MODES— Secondary level overlay which reads mode shapes and thickness slope functions

Program VICMAIN — Secondary level overlay which calculates all
Aerodynamic Influence Coefficients

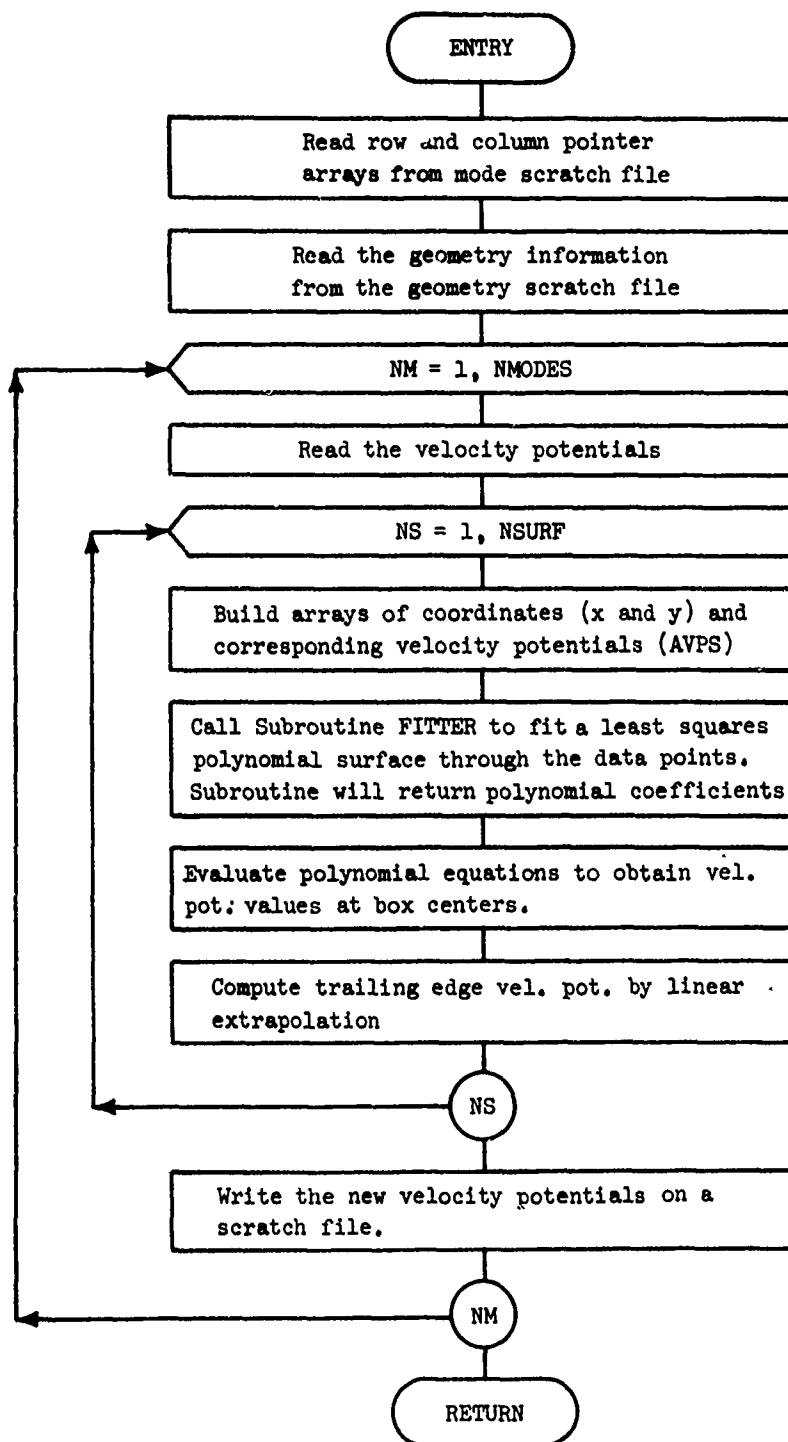

Program NWVirt Secondary overlay which calculates normal washes and velocity potentials.

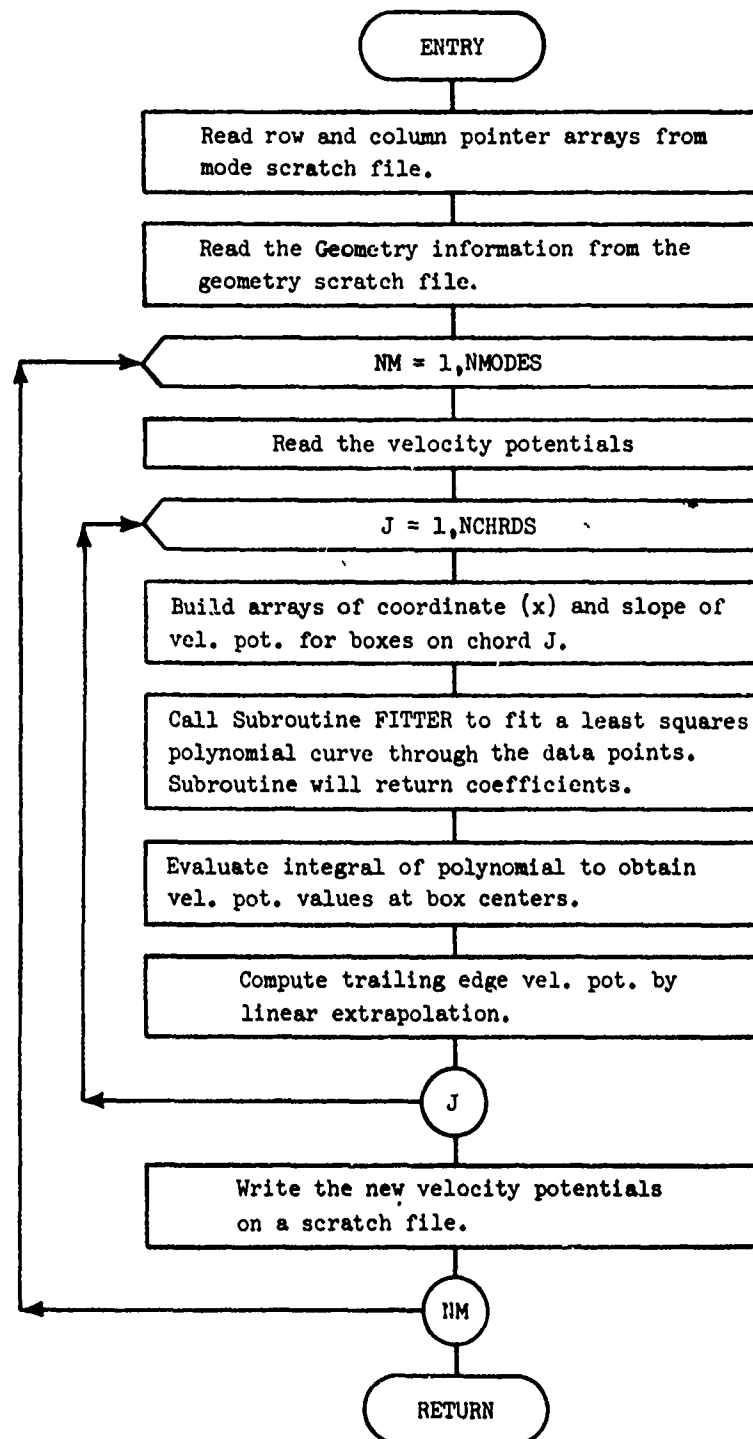

Program SMTH

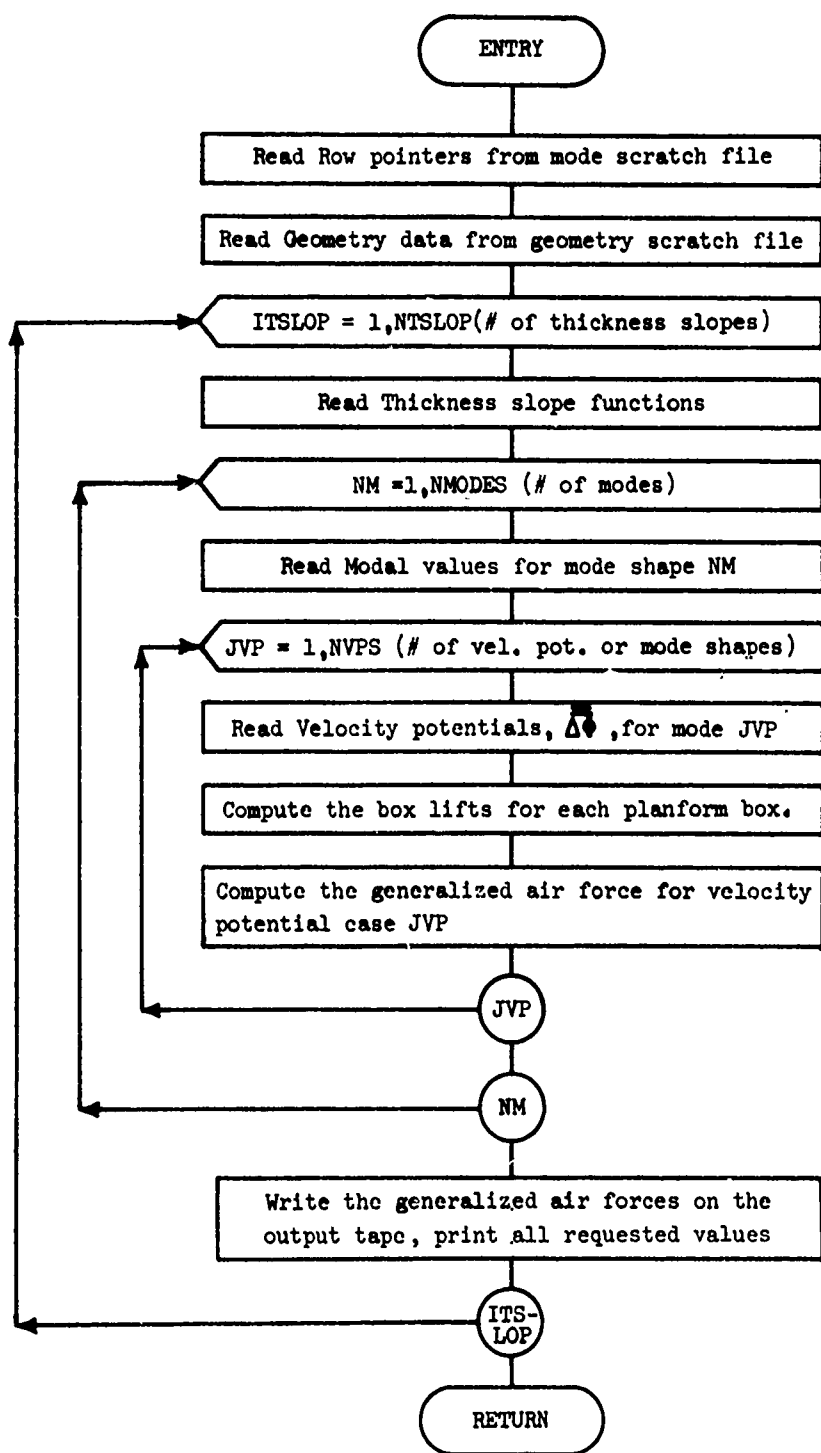

Secondary overlay which smooths velocity potentials
by fitting a least squares surface through them

Program CHORDF — Secondary overlay which smooths velocity potentials by fitting a least squares curve along each chord.

Program FORCES Secondary overlay which computes box lifts
section lifts, and generalized air forces

APPENDIX A

SAMPLE INPUT AND OUTPUT DATA

A simple spatial configuration, shown in Figure 23, was chosen as a sample problem for the demonstration of the card data input and a selection of the printed output. The planform used is a pair of identical rectangular surfaces (wing and tail) with small horizontal and vertical separation.

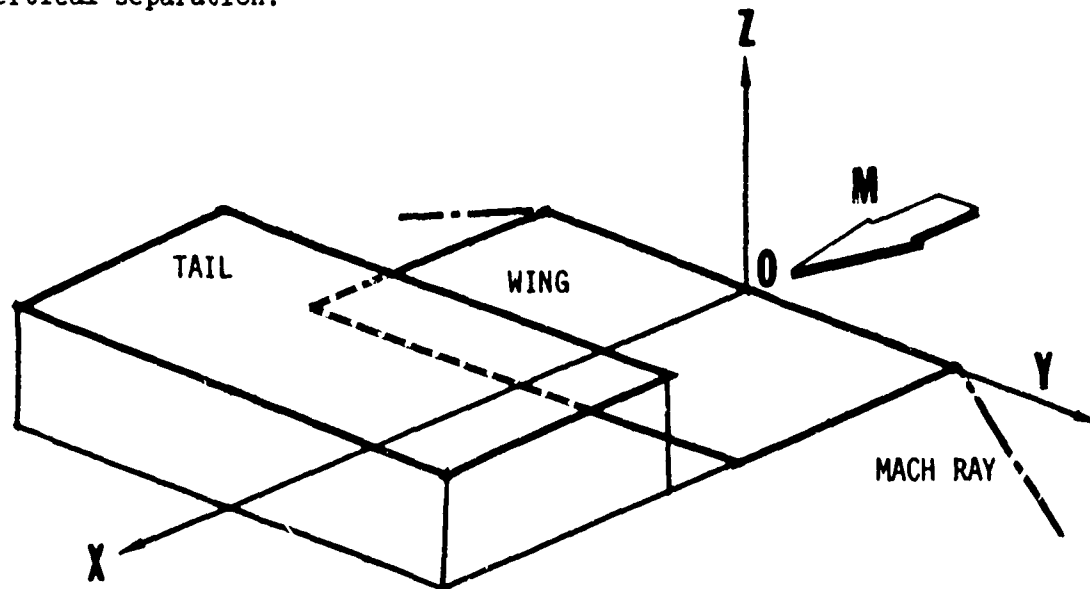

FIGURE 23 SAMPLE PROBLEM CONFIGURATION

The configuration was analyzed at Mach 1.2 for a reduced frequency (based on semi-span) of .5. Only the wing surface was allowed to oscillate, in plunging motion for mode 1 and in pitch about the wing leading edge for mode 2. These two modes were input on cards as polynomials. Chordwise velocity potential smoothing was requested.

In the interest of space the printout was edited to give samples only. A few pages of one spatial AIC array and the planar AIC are included, as well as most of the computations for mode 2 (wing pitch). Since for this configuration the upper and lower surface normal wash differs only in sign, only the upper normal washes are included. The generalized force calculations at the end are for smoothed velocity potentials.

 OUTPUT TAPE = 1 SPACED 0 FILES,

A 4

THE FOLLOWING IS THE REDUCED FREQUENCY ARRAY BASED ON WING SEMI-SPAN

.50000

ENTERING PROGRAM GEOM CURRENT ELAPSED TIME IS CP = .224, FP = 37.757

----- GEOMETRIC PARAMETERS -----

CARD1 -LOCAL AXES DEFINITION- X-LOCATION Z-LOCATION DIHEDRAL ANGLE (FST)
 WING 0.000 0.000 0.00 DEGREES
 TAIL 1.200 .400 0.00 DEGREES

CARD2 -BOX PATTERN DEFINITION- NCHRS XCENTR OR XEDGE
 10 #0000.0000 0.0000

CARD3 -FLANFORM DEFINITION POINT COUNTS- LEADING EDGE TRAILING EDGE
 WING 2 2
 TAIL 2 2

CARD4 TO CARD6 -FLANFORM DEFINITIONS- X Y (LOCAL AXES)
 WING L.E. 0.000 0.000
 0.000 1.000

| | | |

| 13. ABSTRACT <p>The Mach box technique has been extended to include wing and tail with dihedral angles and vertical separation. A digital computer program, written in FORTRAN, is presented. The program provides for up to nine sweep angles of the leading and trailing edges of each surface. First order piston theory thickness correction is available as an option and two refinement procedures are provided, subdivision with averaging and velocity potential smoothing. For a maximum of twenty oscillatory mode shapes the program calculates normal washes, velocity potentials, lifts, pressures and generalized forces matrices. If only one surface is being analyzed, sampling of wake up-wash, side-wash and longitudinal wash is available.</p> <p>The methods described in this report are intended to be used by airplane designers to calculate with improved accuracy, the unsteady aerodynamic loads that act on a lifting surface being propelled at supersonic speeds. The new feature of these calculations is that the aerodynamic interference between the wing and tail has been taken into account. These calculations are an essential ingredient of flutter analyses and will improve the confidence level of such calculations in preventing wing-tail flutter. The general requirement for such calculations are contained in Military Specification MIL-A-8870A (USAF).</p> | | |
